

# Winning Space Race with Data Science

Mduduzi S Nkomo  
5/12/2025

# Outline

---

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

# Executive Summary

- **Methodologies :**
  - Data Acquisition and Web Scraping (Python libraries (requests, BeautifulSoup))
  - Data Wrangling and Preparation ( Python libraries (pandas, numpy), SQL (SQLite))
  - Exploratory Data Analysis (EDA) & Visualization (**Tools:** Python (pandas, plotly.express, folium), SQL)
  - Feature Engineering and Preparation for ML ()
- **Overall Results :**
  - The **Support Vector Classifier (SVC)** emerged as the most effective model for this dataset, achieving the highest overall accuracy of approximately **85%** and strong performance across all metrics.
  - The **Logistic Regression** and **Decision Tree** models performed comparably well, both reaching an accuracy of approximately **81%** and balanced F1 scores.
  - The **K-Nearest Neighbors (KNN)** model demonstrated significantly lower performance, particularly in precision and F1-score, indicating it was the least suitable model for predicting SpaceX launch outcomes among those tested.
  - The success rate of each launch site differed from one to another with KSC LC-39A (Kennedy Space Center Launch Complex 39A) for falcon 9
  - )

# Introduction

- **Project background and context:**
- Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch
- **Problems you want to find answers:**
- Predict if the first stage of falcon 9 will land successfully
- Success rate of Falcon 9 per launch site
- Predict if the landing will be successful
- Features that have an effect on a successful landing

Section 1

# Methodology

# Methodology

## Executive Summary

### Data collection methodology:

Collected the data with an API and webscraping

### Perform data wrangling

Performed EDA to identify necessary data and filtered the data

### Perform exploratory data analysis (EDA) using visualization and SQL

### Perform interactive visual analytics using Folium and Plotly Dash

### Perform predictive analysis using classification models

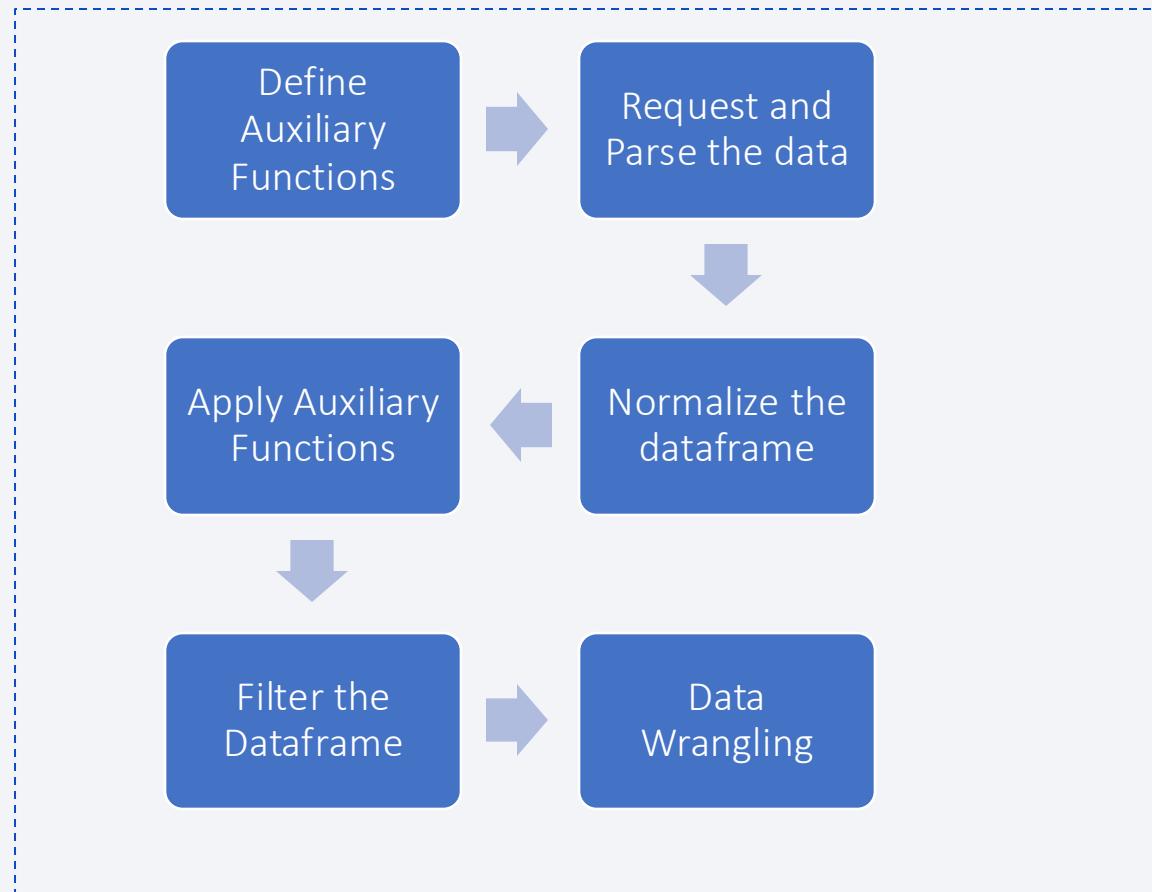

Used DecisionTree , KNeighborsClassifier , SVC & Logistic regression to select the best model

# Data Collection

- I collected the Data for Space X using 2 methods :
  - Web-scraping : Collected the data from the Internet
  - Application Programming Interface
- After extracting the data from web-scraping I transformed it into a form by removing all the tags from the data and using python code to appropriately format it into a readable format.
- When I used an API I started by defining Auxiliary Functions which extracted the data and store it in a variable I normalized and stored it in a data frame for further processing

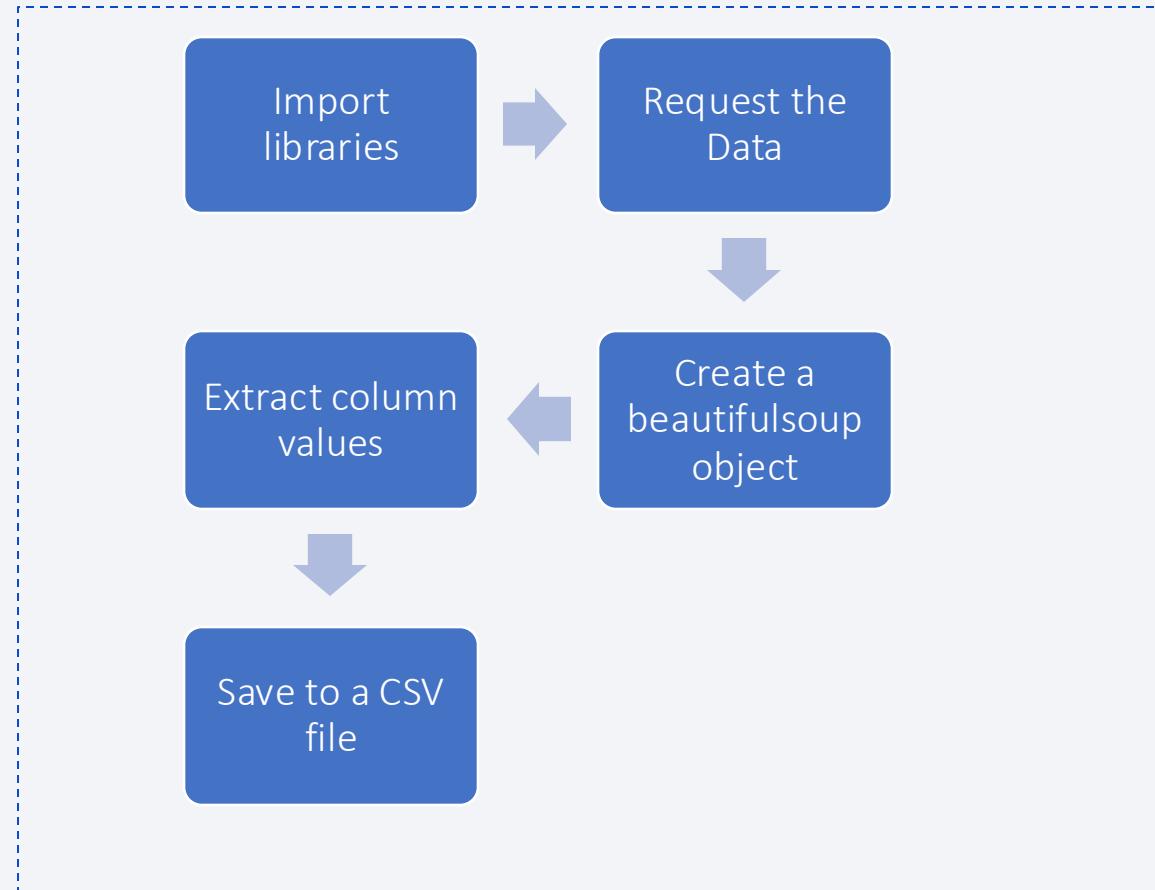

# Data Collection – SpaceX API

- Present your data collection with SpaceX REST calls using key phrases and flowcharts
- [https://github.com/Emitrisia/Space\\_Y/blob/main/jupyter-labs-spacex-data-collection-api.ipynb](https://github.com/Emitrisia/Space_Y/blob/main/jupyter-labs-spacex-data-collection-api.ipynb)

# Data Collection - Scraping

- Present your web scraping process using key phrases and flowcharts
- <https://github.com/Emitrisia/Emitrisia/blob/main/jupyter-labs-webscraping.ipynb>

# Data Wrangling

Data Wrangling is the process of cleaning the data .

In Data Wrangling we started with checking for missing values in the columns

Then I replaced the missing values with the mean of that column

After that I saved the file to a csv for further Analysis

[https://github.com/Emitrisia/Emitrisia/blob/main/labs-jupyter-spacex-Data%20wrangling%20\(2\).ipynb](https://github.com/Emitrisia/Emitrisia/blob/main/labs-jupyter-spacex-Data%20wrangling%20(2).ipynb)

Checking for  
null values

Replacing  
null Values

Saving

# EDA with Data Visualization

- We use Exploratory Data Analysis(EDA) with data Visualization to identify how different features affect or have an effect on our target variable . To identify correlation and relationships between variables .
- In this project I used various data visualizations for EDA which include :
  - Scatterplots
  - Catplots
  - Lineplots
  - Bar Chart

# EDA with SQL

- Selecting Unique Launch sites data from the Table
- Selecting Launch Site with string CCA
- Displaying Total Payload Mass launched by Nasa
- Average Payload Mass by F 9 booster version
- Date of the first successful landing on ground pad
- Names of the boosters which have success in drone ship and have payload mass > 4000& < 6000
- Total number of successful and failure mission outcomes
- List all the booster\_versions that have carried the maximum payload mass
- the records which will display the month names, failure landing\_outcomes in drone ship ,booster versions, launch\_site for the months in year 2015.
- Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order

# Build an Interactive Map with Folium

- Added Circle markers , Mouse pointer , Launch site Marker popups and Lines to indicate distance to and from the launch sites
- Explain why you added those objects
- Circle Markers were used to mark the radius of the Launch sites
- Added Mouse pointer to know the exact coordinates of an infrastructure to a launch site
- Launch site Marker popups were used to help us visualize successful and failed landing attempts
- Lines were used to measure and help us know the distance of the nearest infrastructure to the Launch Site
- <https://github.com/Emitrisia/Emitrisia/blob/main/Interactive%20Visual%20Analytics%20with%20Folium.ipynb>

# Build a Dashboard with Plotly Dash

I used a pie chart and a scatter pot

I used those data visualization to output  
launch site success rate and how different  
payload mass affected the success rate

Kennedy Space Center () showed high  
success rate of successful landings from  
other launch sites

# Predictive Analysis (Classification)

---

I started by loading the data into a data frame then I separated the data into X (Independent variable) & Y (Dependent variable ).

Then I used standard scaler for the feature X to standardize the dataset , after that I split the data into training and testing sets 80% for training .

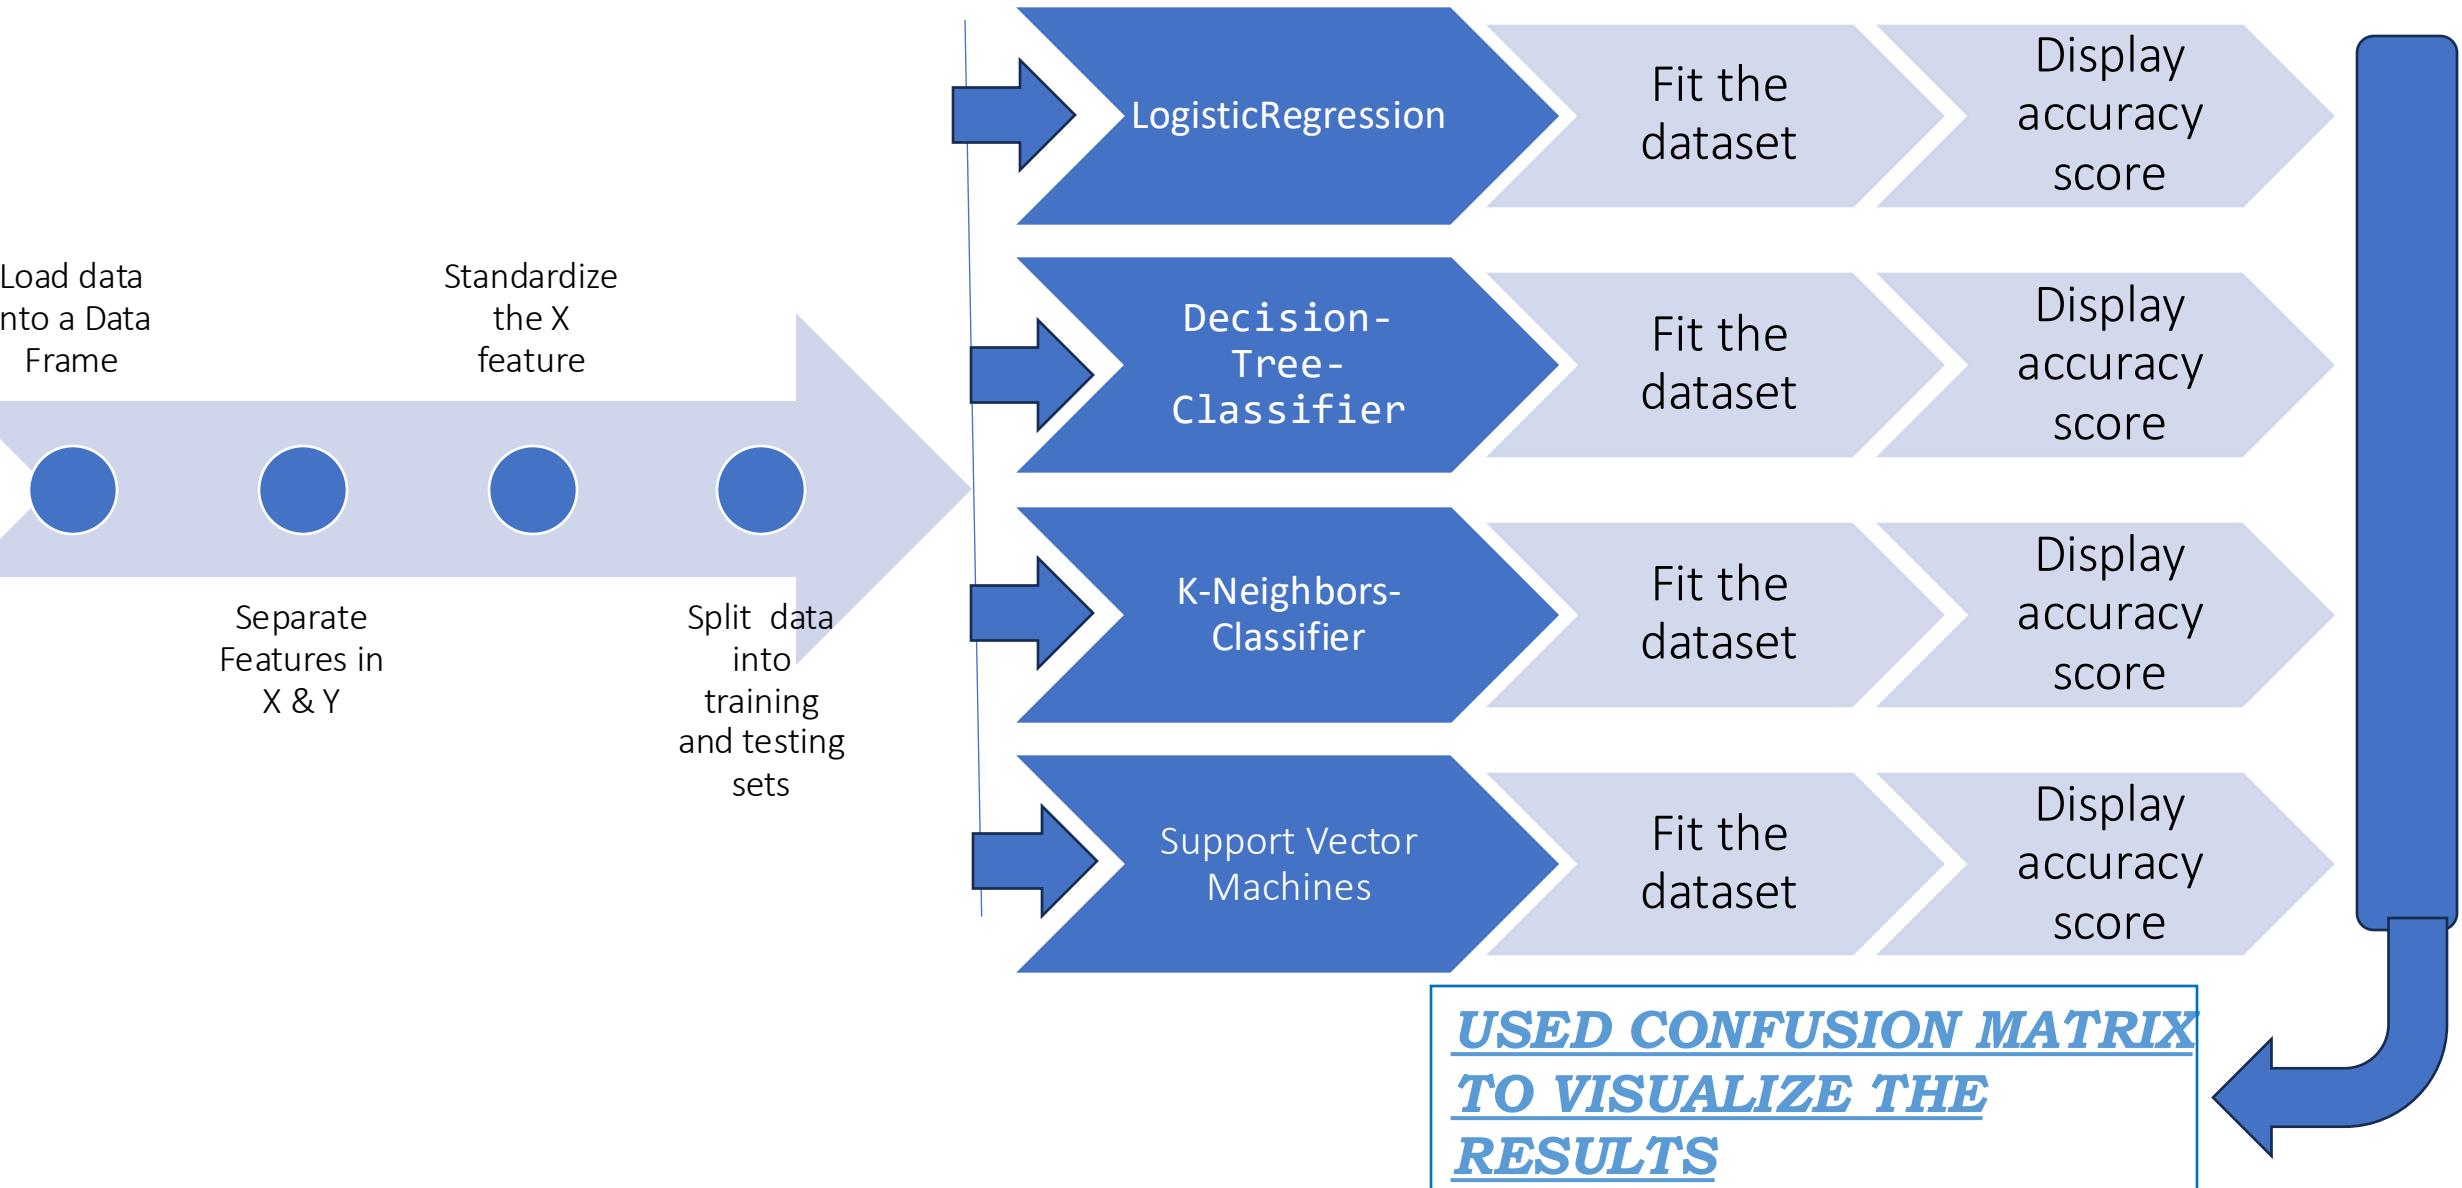

I then used logistic regression to train and test the model and to see the accuracy of the model , I also used Decision Tree Classifier , Support Vector Machines and K-Neighbors-Classifier

After fitting the data to each method I used a confusion matrix to visualize the results

# Predictive Analysis (Classification)

# Results

- I used EDA to see the features and effect on the dependent value and I noticed that success rate has been steadily increasing from 2013 until 2020
- I also noticed that Payload and Orbit type have a great effect on the success rate
- VAFB-SLC launch site there are no rockets launched for heavy payload mass(greater than 10000)
- With heavy payloads the successful landing or positive landing rate are more for Polar ,LEO and ISS
- I also tried to visualize the relationship between orbit type and payload mass

# Predictive Analysis Results

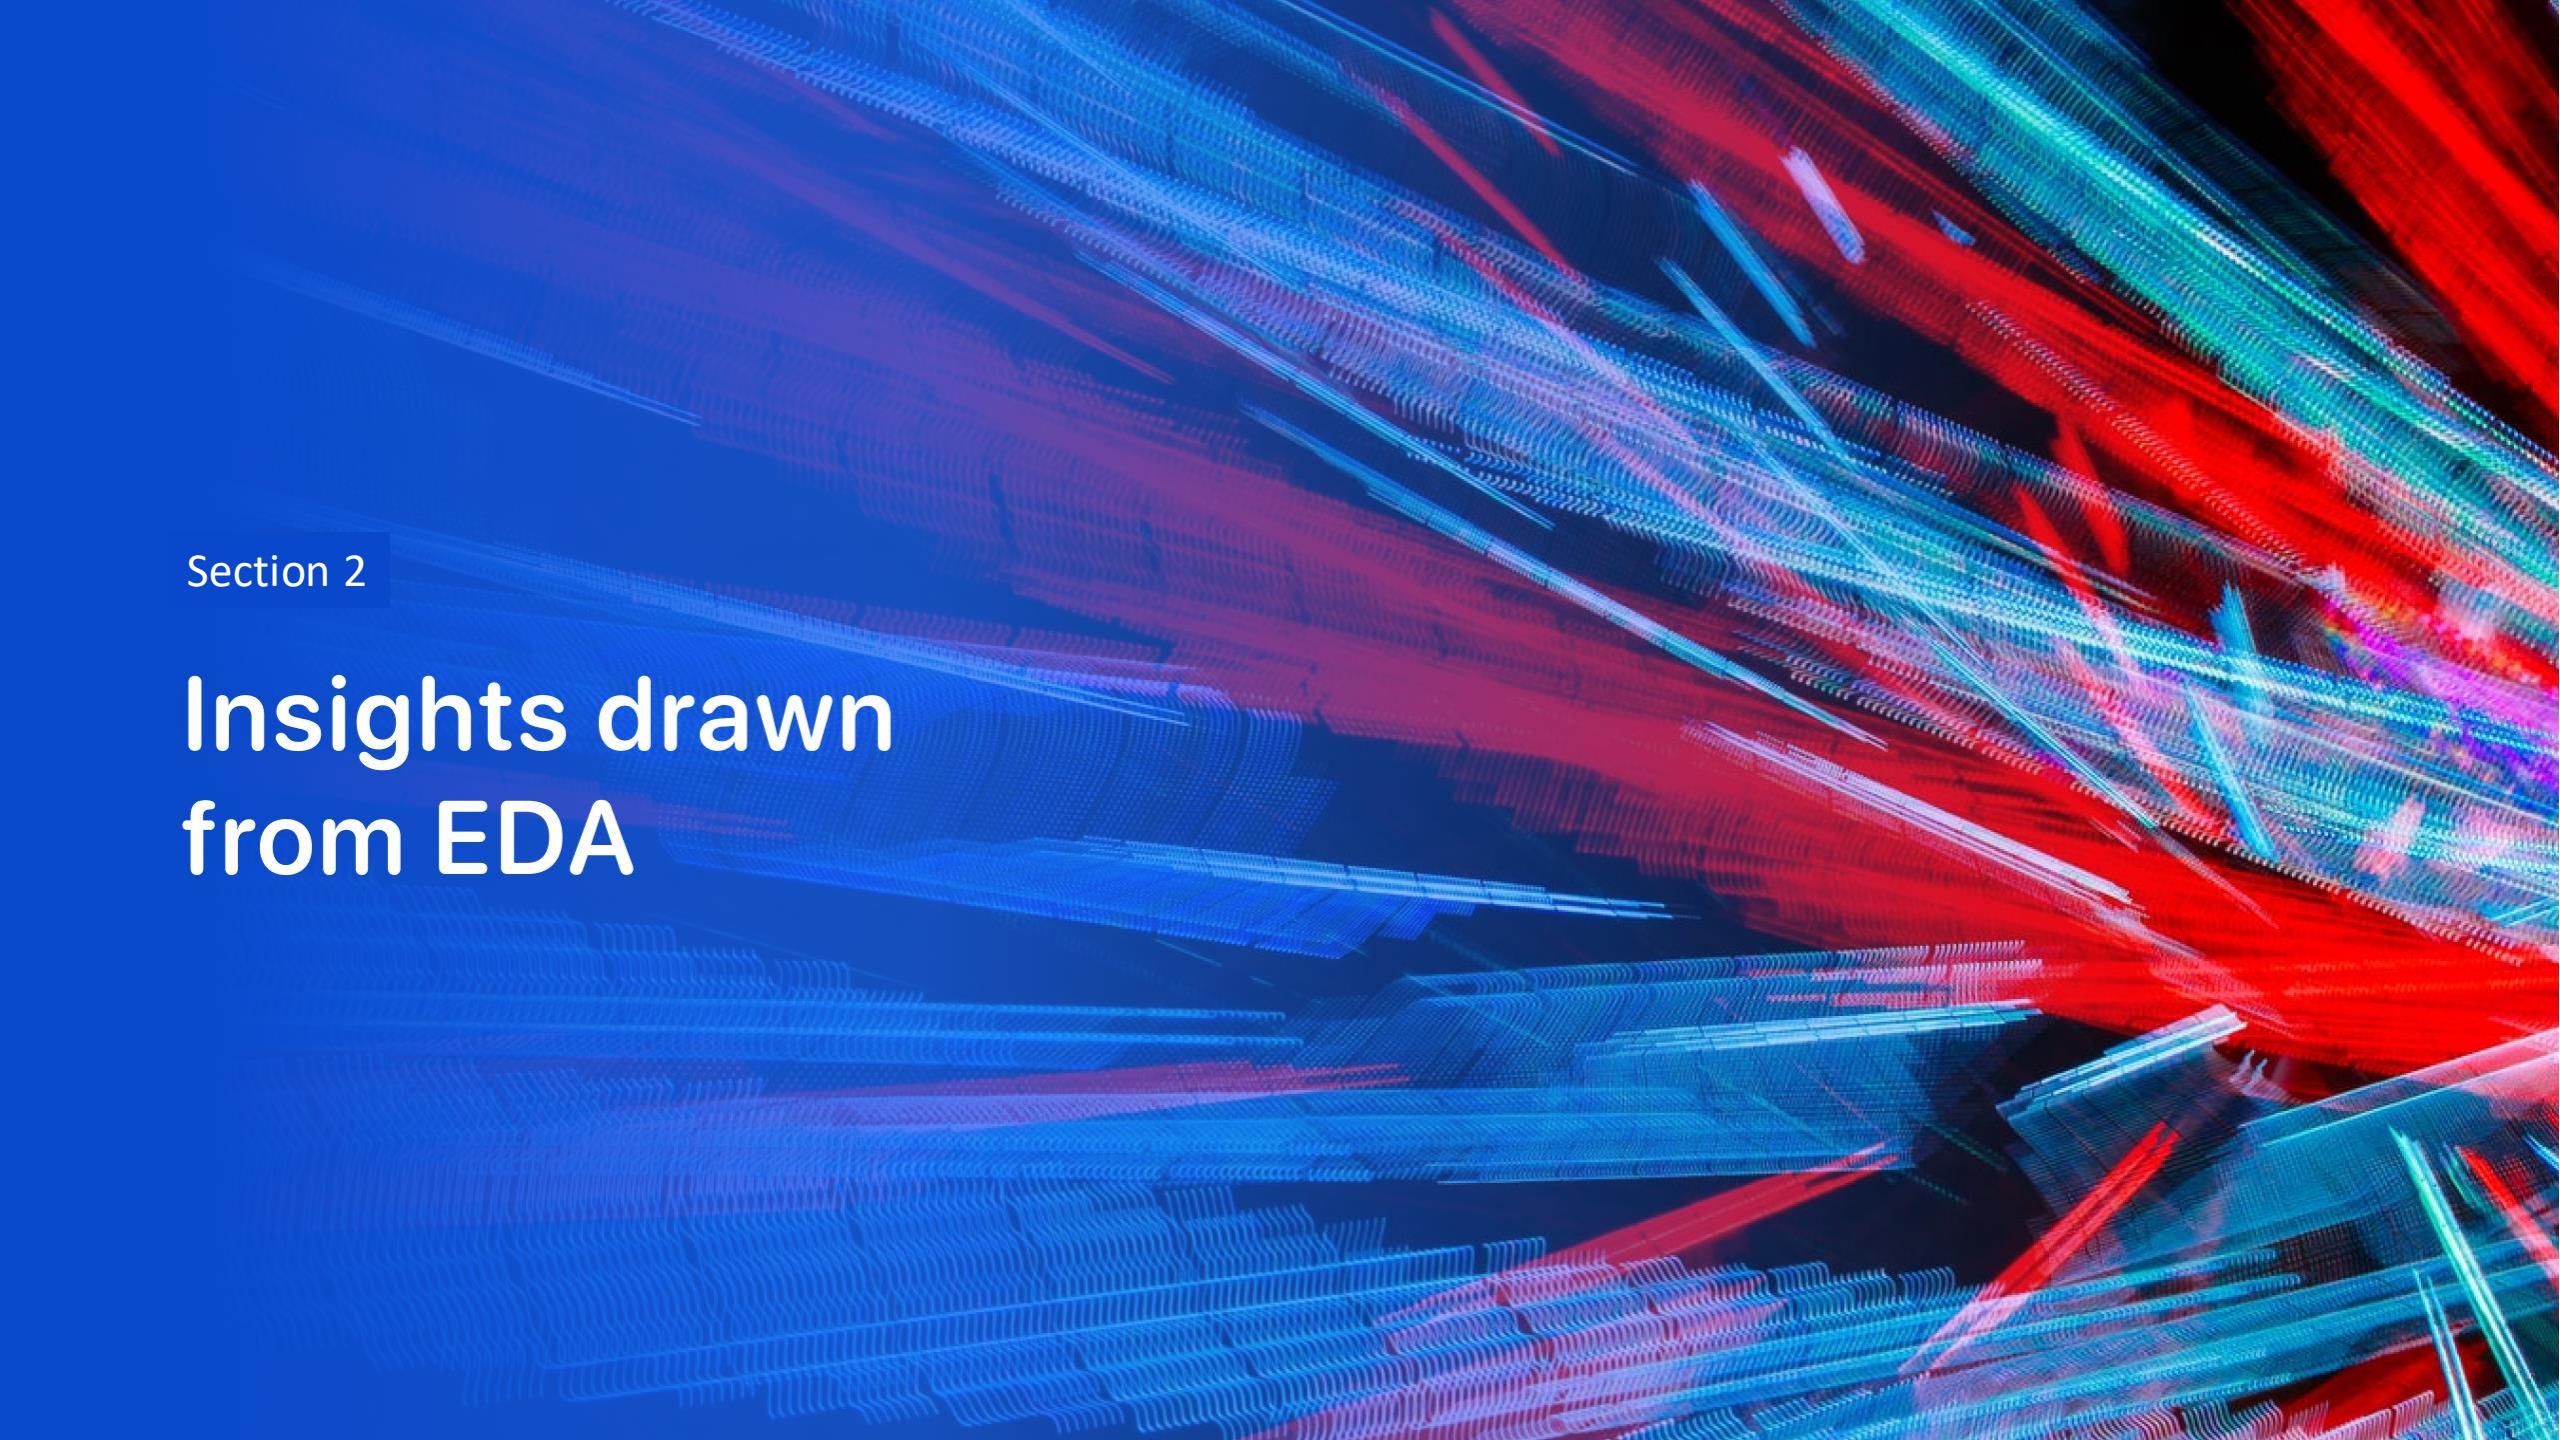

The **Support Vector Classifier (SVC)** emerged as the most effective model for this dataset, achieving the highest overall accuracy of approximately **85%** and strong performance across all metrics.

The **Logistic Regression** and **Decision Tree** models performed comparably well, both reaching an accuracy of approximately **81%** and balanced F1 scores.

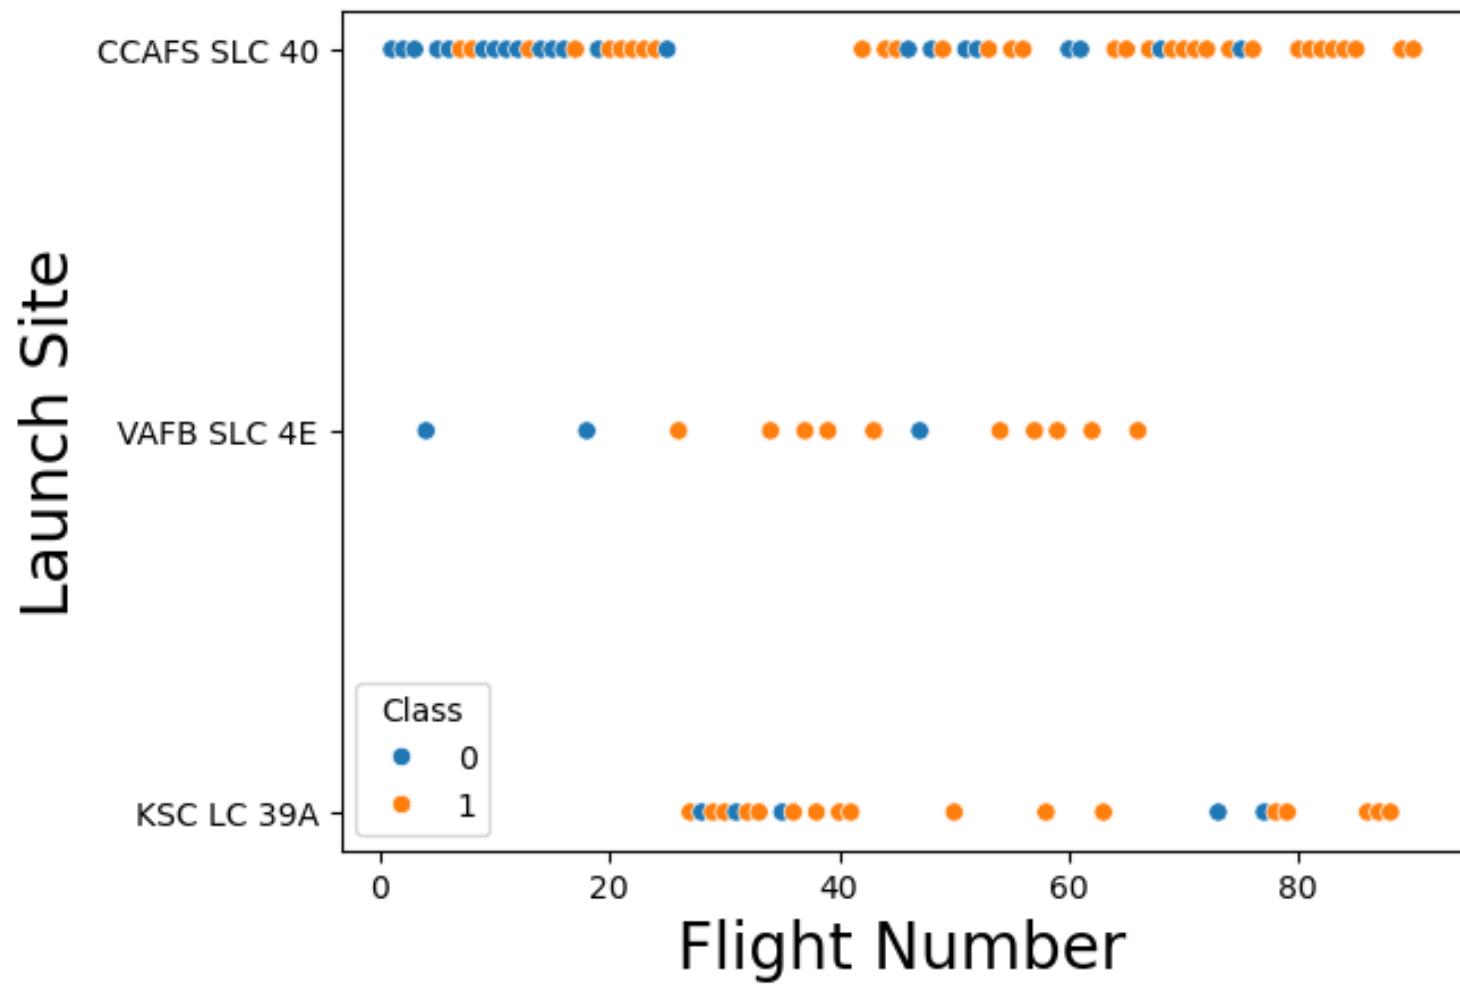

The **K-Nearest Neighbors (KNN)** model demonstrated significantly lower performance, particularly in precision and F1-score, indicating it was the least suitable model for predicting SpaceX launch outcomes among those tested.

The background of the slide features a complex, abstract digital visualization. It consists of numerous thin, glowing lines that create a sense of depth and motion. The lines are primarily blue and red, with some green and purple highlights. They form a grid-like structure that curves and twists across the frame, resembling a 3D wireframe or a network of data points. The overall effect is futuristic and dynamic, suggesting concepts like data flow, digital communication, or complex systems.

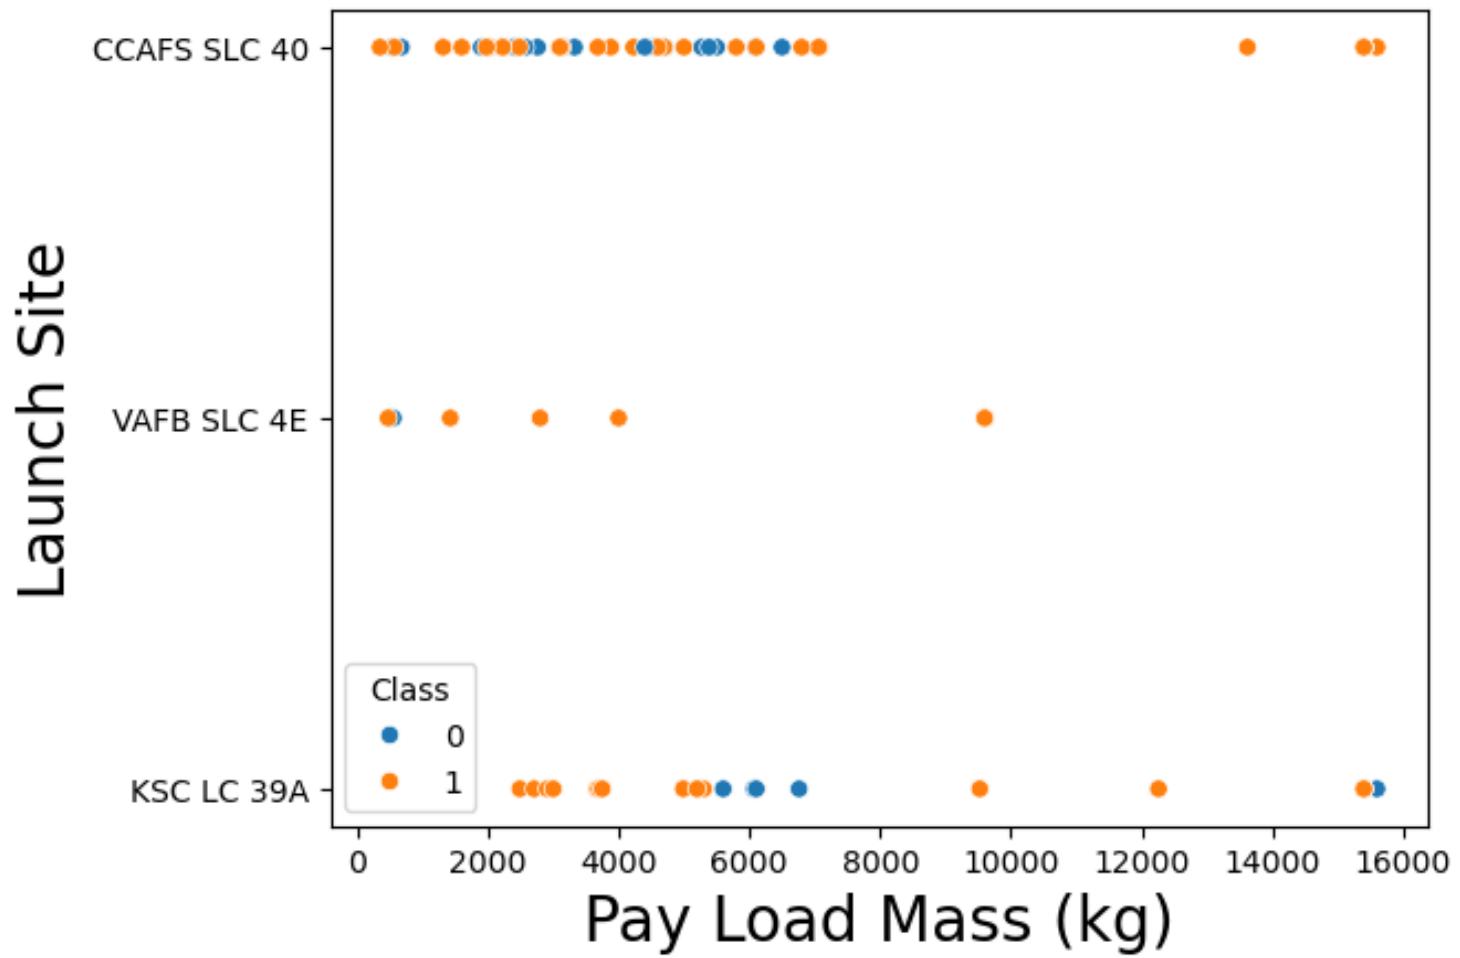

Section 2

## Insights drawn from EDA

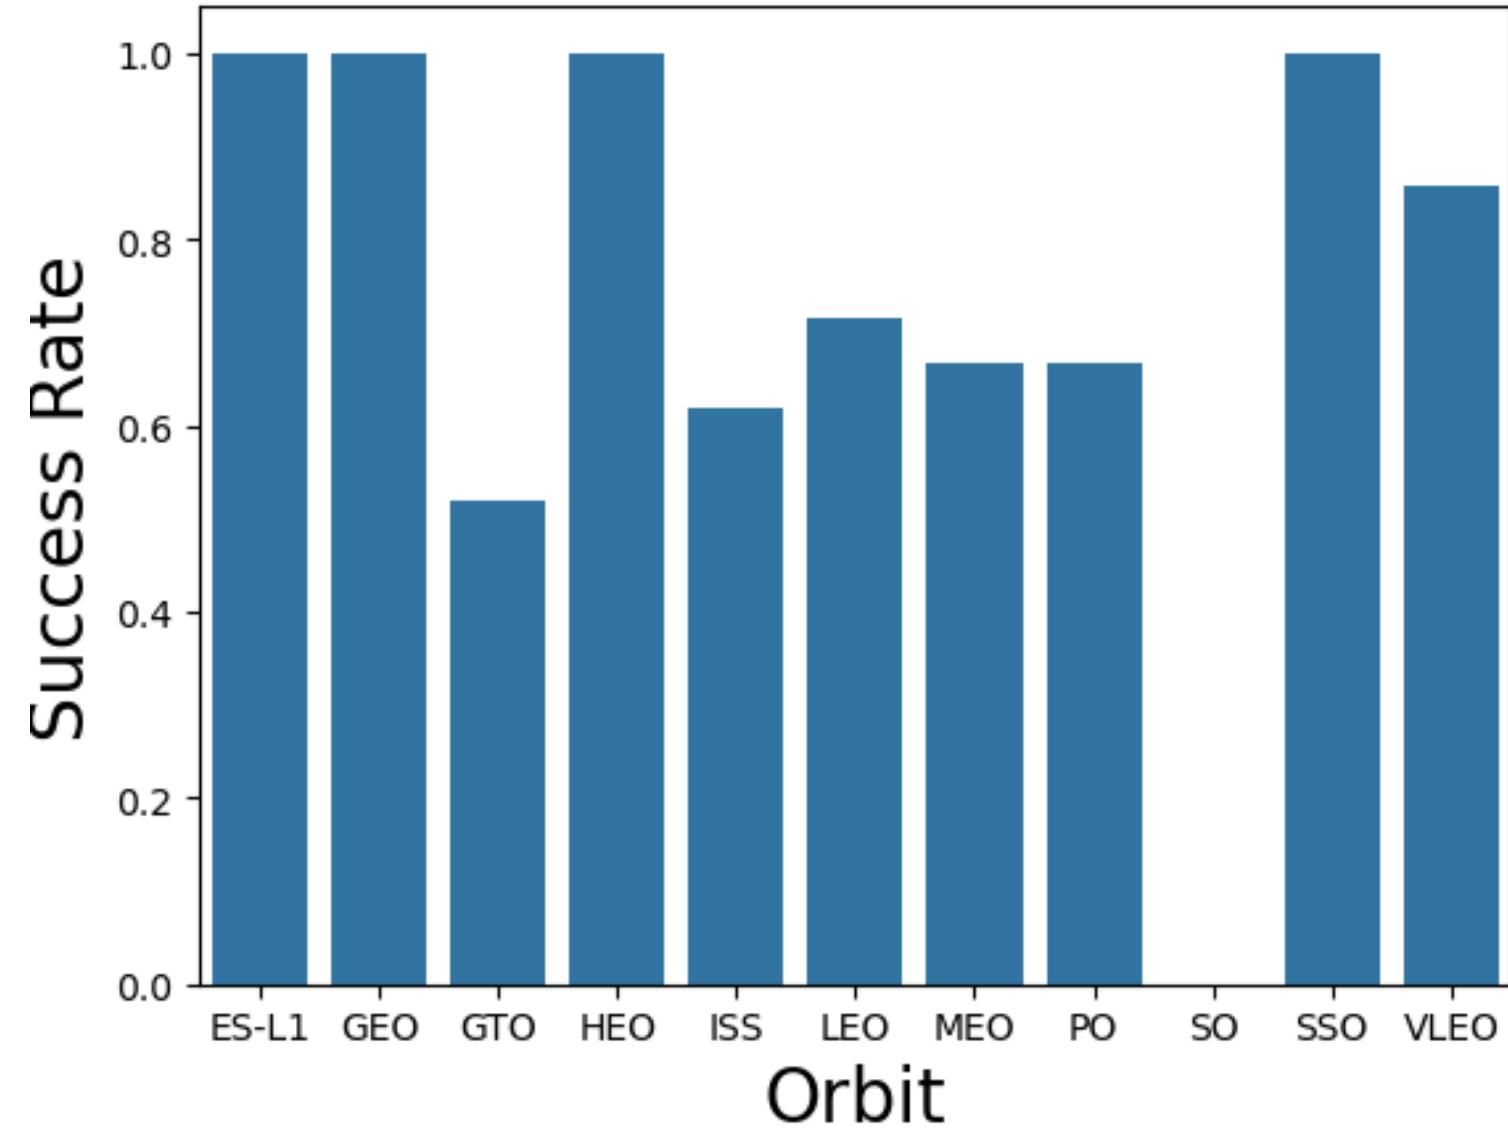

# Flight Number vs. Launch Site

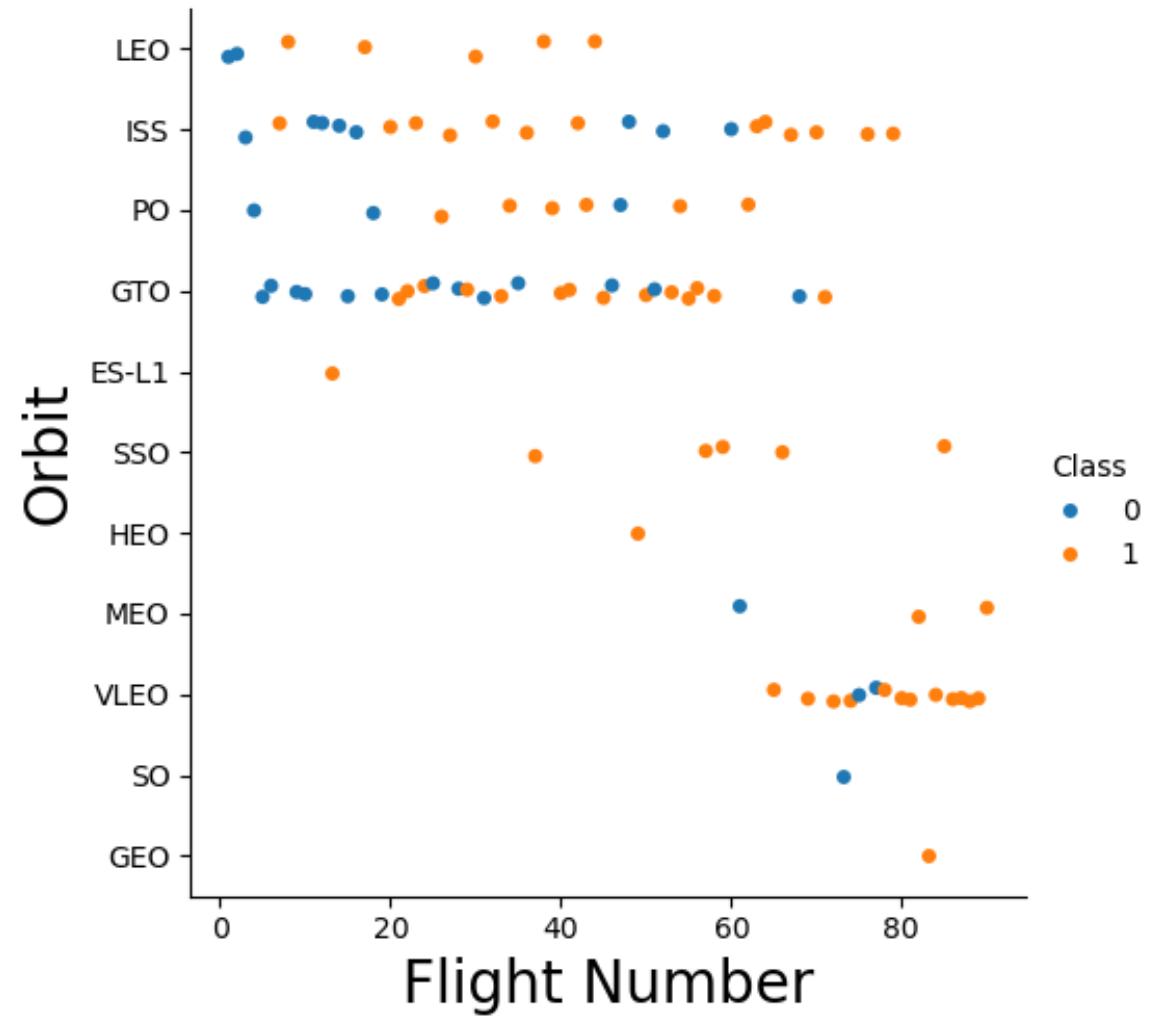

## Payload vs. Launch Site

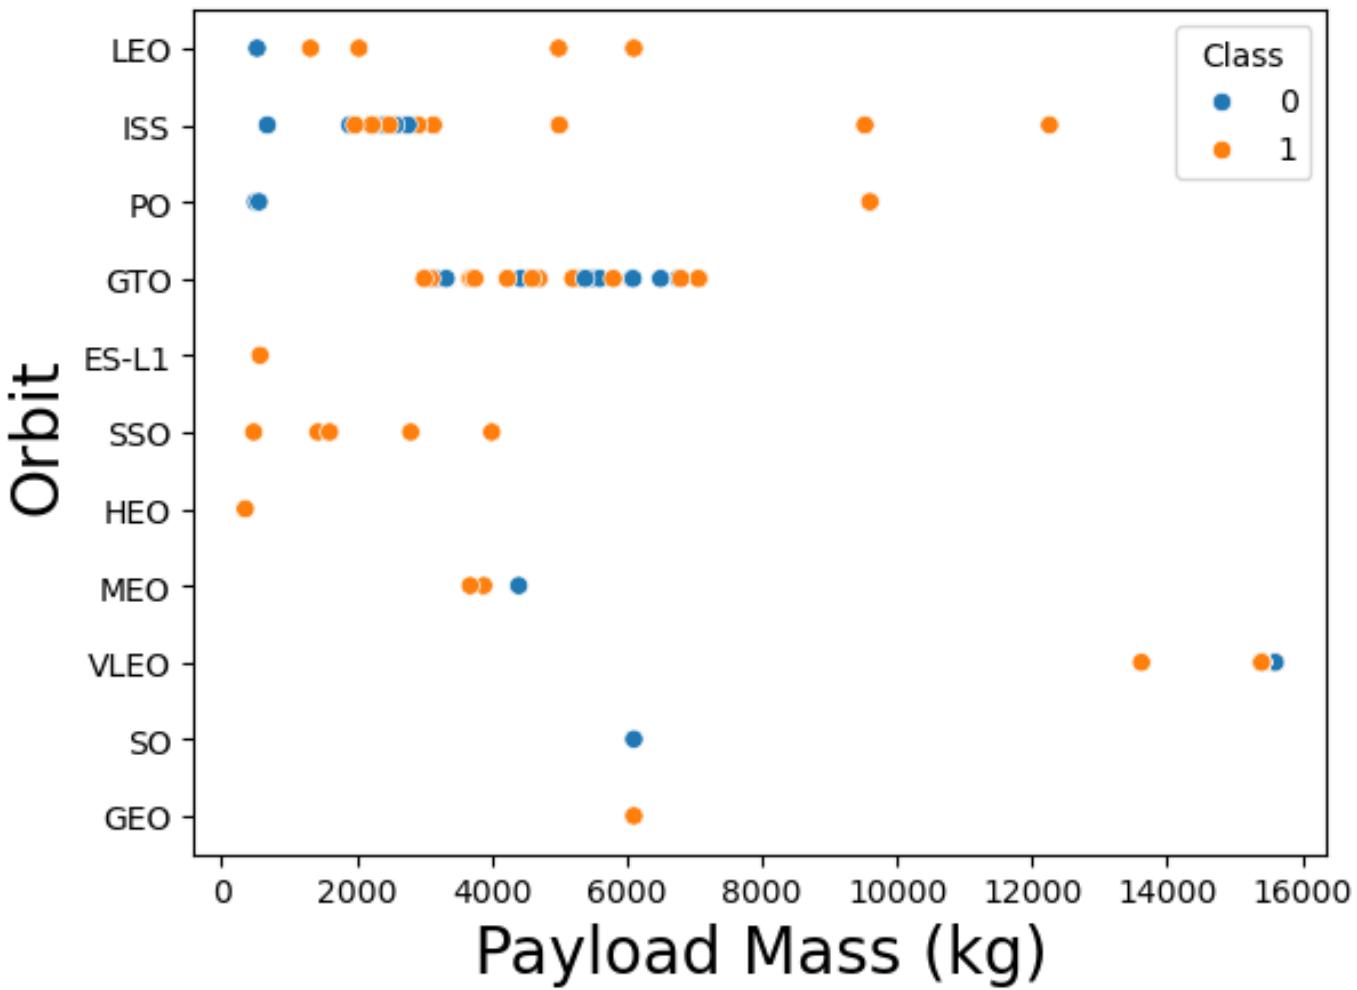

# Success Rate vs. Orbit Type

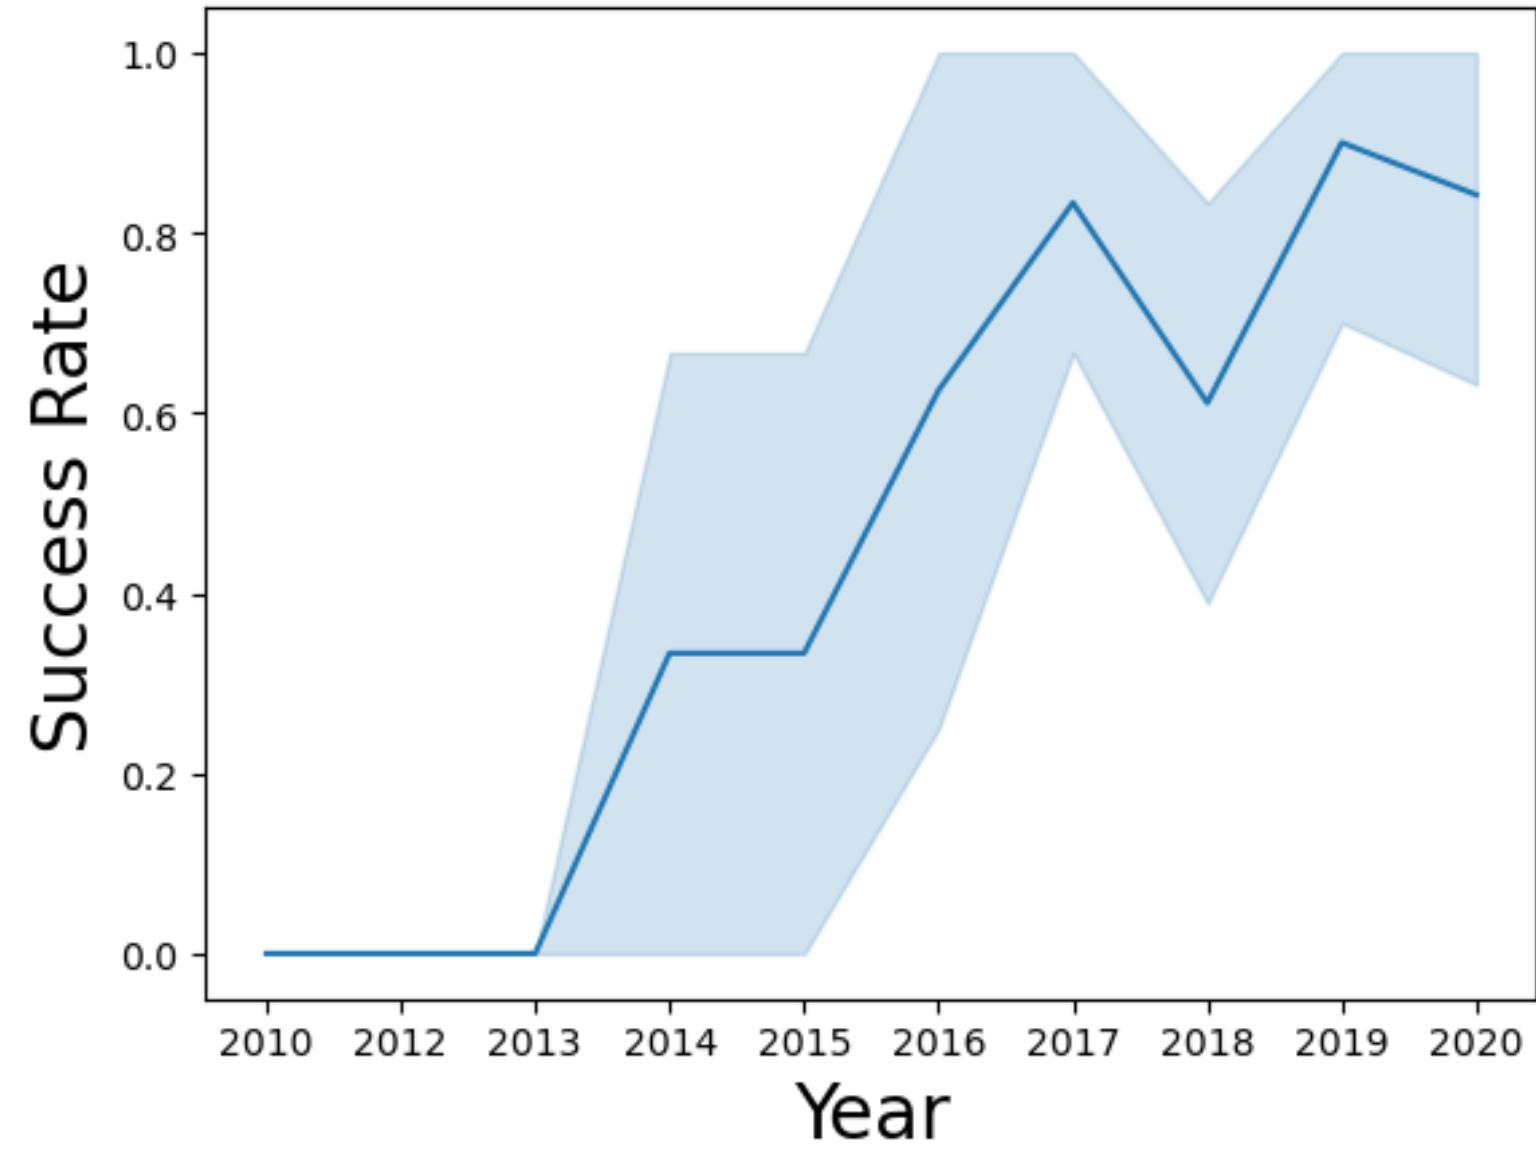

# Flight Number vs. Orbit Type

## Payload vs. Orbit Type

# Launch Success Yearly Trend

CCAFS LC-40

VAFB SLC-4E

KSC LC-39A

CCAFS SLC-40

---

# All Launch Site Names

# Launch Site Names Begin with 'CCA'

- 5 records where launch sites begin with 'CCA'
- ```
%sql SELECT * FROM SPACEXTABLE WHERE Launch_Site  
LIKE 'CCA%' LIMIT 5;
```
- This selects all the columns from the table and outputs the site names that begin with CCA and limits to the first 5 rows of the queried dataset

# Total Payload Mass

- The total payload carried by boosters from NASA:
- %sql SELECT SUM(PAYLOAD\_MASS\_\_KG\_) FROM SPACEXTABLE WHERE Customer LIKE 'NASA (CRS)';
- This adds up all the values of payload mass column when the customer is NASA

# Average Payload Mass by F9 v1.1

- The average payload mass carried by booster version F9 v1.1:
- %sql SELECT AVG(PAYLOAD\_MASS\_\_KG\_) FROM SPACEXTABLE WHERE Booster\_Version LIKE 'F9 v1.1%';
- This displays the mean for Average Mass when the booster version column value starts with F9 v1.1

# First Successful Ground Landing Date

- The dates of the first successful landing outcome on ground pad
- %sql SELECT Date FROM SPACEXTABLE WHERE Landing\_Outcome LIKE '%ground%' LIMIT 1;
- Outputs the date of the first successful ground landing

30

# Successful Drone Ship Landing with Payload between 4000 and 6000

- The names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 but less than 6000 :
- %sql SELECT Booster\_Version FROM SPACEXTABLE WHERE Landing\_Outcome LIKE '%drone%' AND PAYLOAD\_MASS\_KG\_ > 4000 AND PAYLOAD\_MASS\_KG\_ < 6000;
- I first selected the column I want as output then I queried the data set to only include data where landing outcome is Drone and payload mass is > 4000 and < 600

# Total Number of Successful and Failure Mission Outcomes

- The total number of successful and failure mission outcomes
- %sql SELECT Mission\_Outcome, COUNT(\*) AS Count FROM SPACEXTABLE GROUP BY Mission\_Outcome;
- This outputs the count of the mission outcome byt grouping data using the mission outcome column

# Boosters Carried Maximum Payload

---

- The names of the booster which have carried the maximum payload mass:

```
%sql SELECT DISTINCT Booster_Version FROM SPACEXTABLE WHERE  
PAYLOAD_MASS__KG_ = (SELECT MAX(PAYLOAD_MASS__KG_) FROM SPACEXTABLE  
);
```

- I used a sub query to find the booster which had the highest payload mass in the data set

F9 B5 B1048.4

F9 B5 B1049.4

F9 B5 B1051.3

F9 B5 B1056.4

F9 B5 B1048.5

F9 B5 B1051.4

# 2015 Launch Records

---

- The failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015 :

```
%sql SELECT  
    SUBSTR(Date, 6, 2) AS Month,  
    Landing_Outcome,  
    Booster_Version,  
    Launch_Site  
FROM SPACEXTABLE  
WHERE SUBSTR(Date, 0, 5) = '2015' AND Landing_Outcome LIKE 'Failure (drone  
ship)%';
```

## Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

---

- Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order :

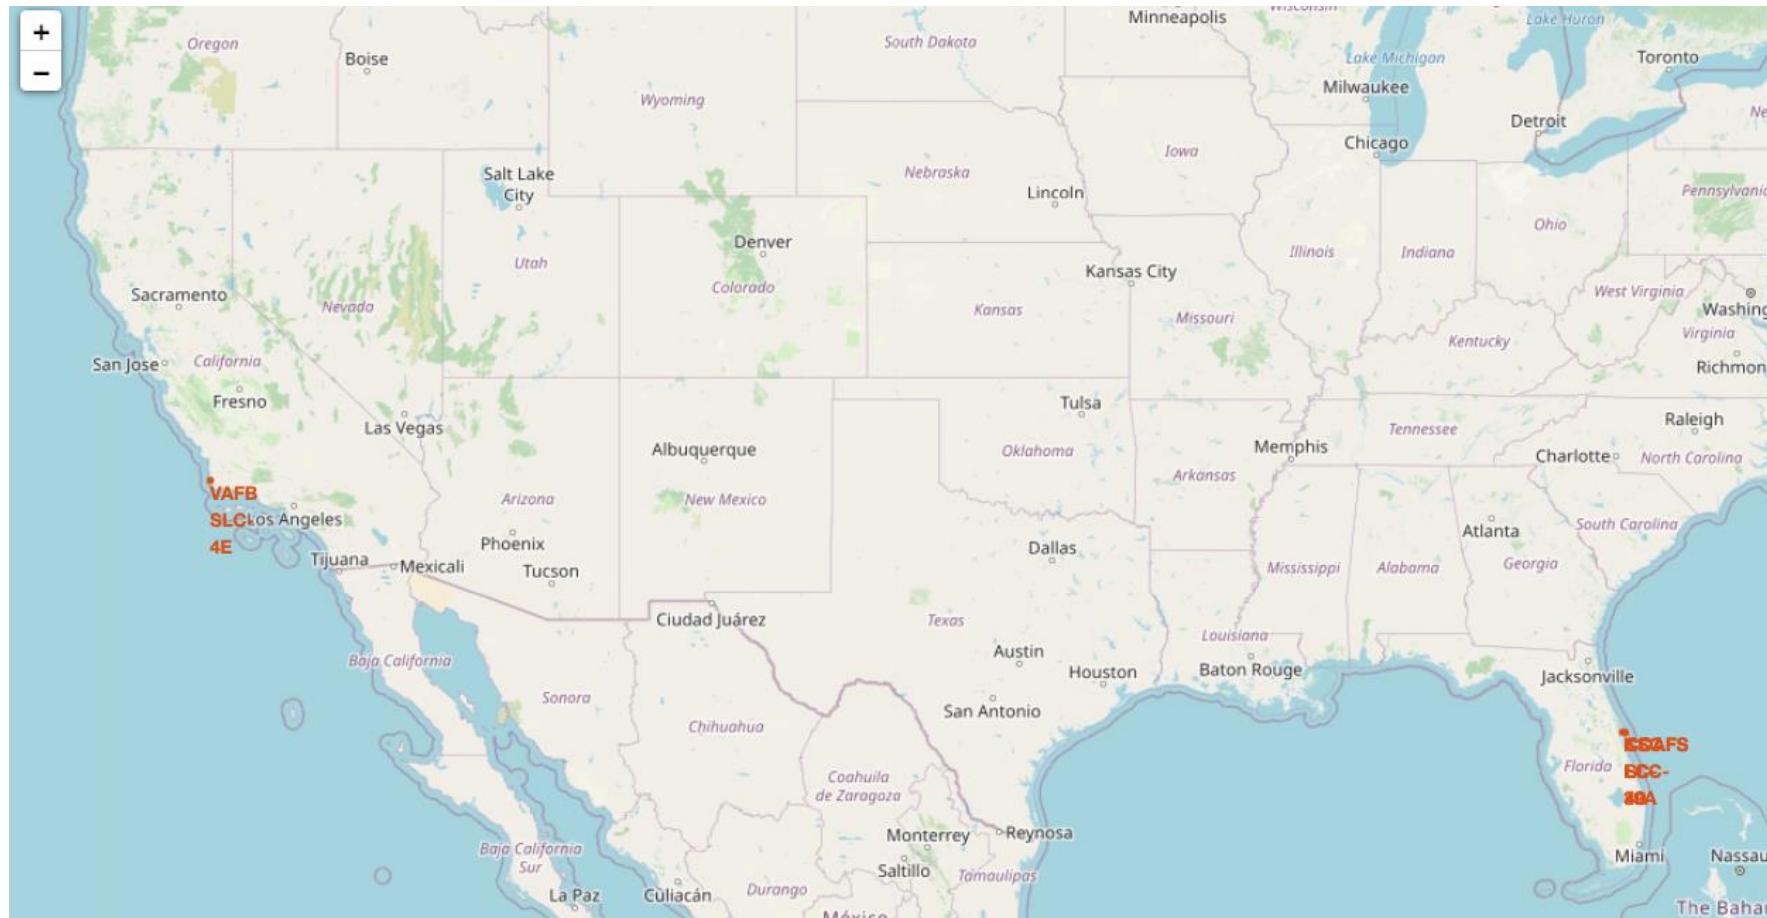

```
%%sql SELECT
    Landing_Outcome,
    COUNT(Landing_Outcome) AS Total_Count
FROM SPACEXTABLE
WHERE Date BETWEEN '2010-06-04' AND '2017-03-20'
GROUP BY Landing_Outcome
ORDER BY Total_Count DESC;
```

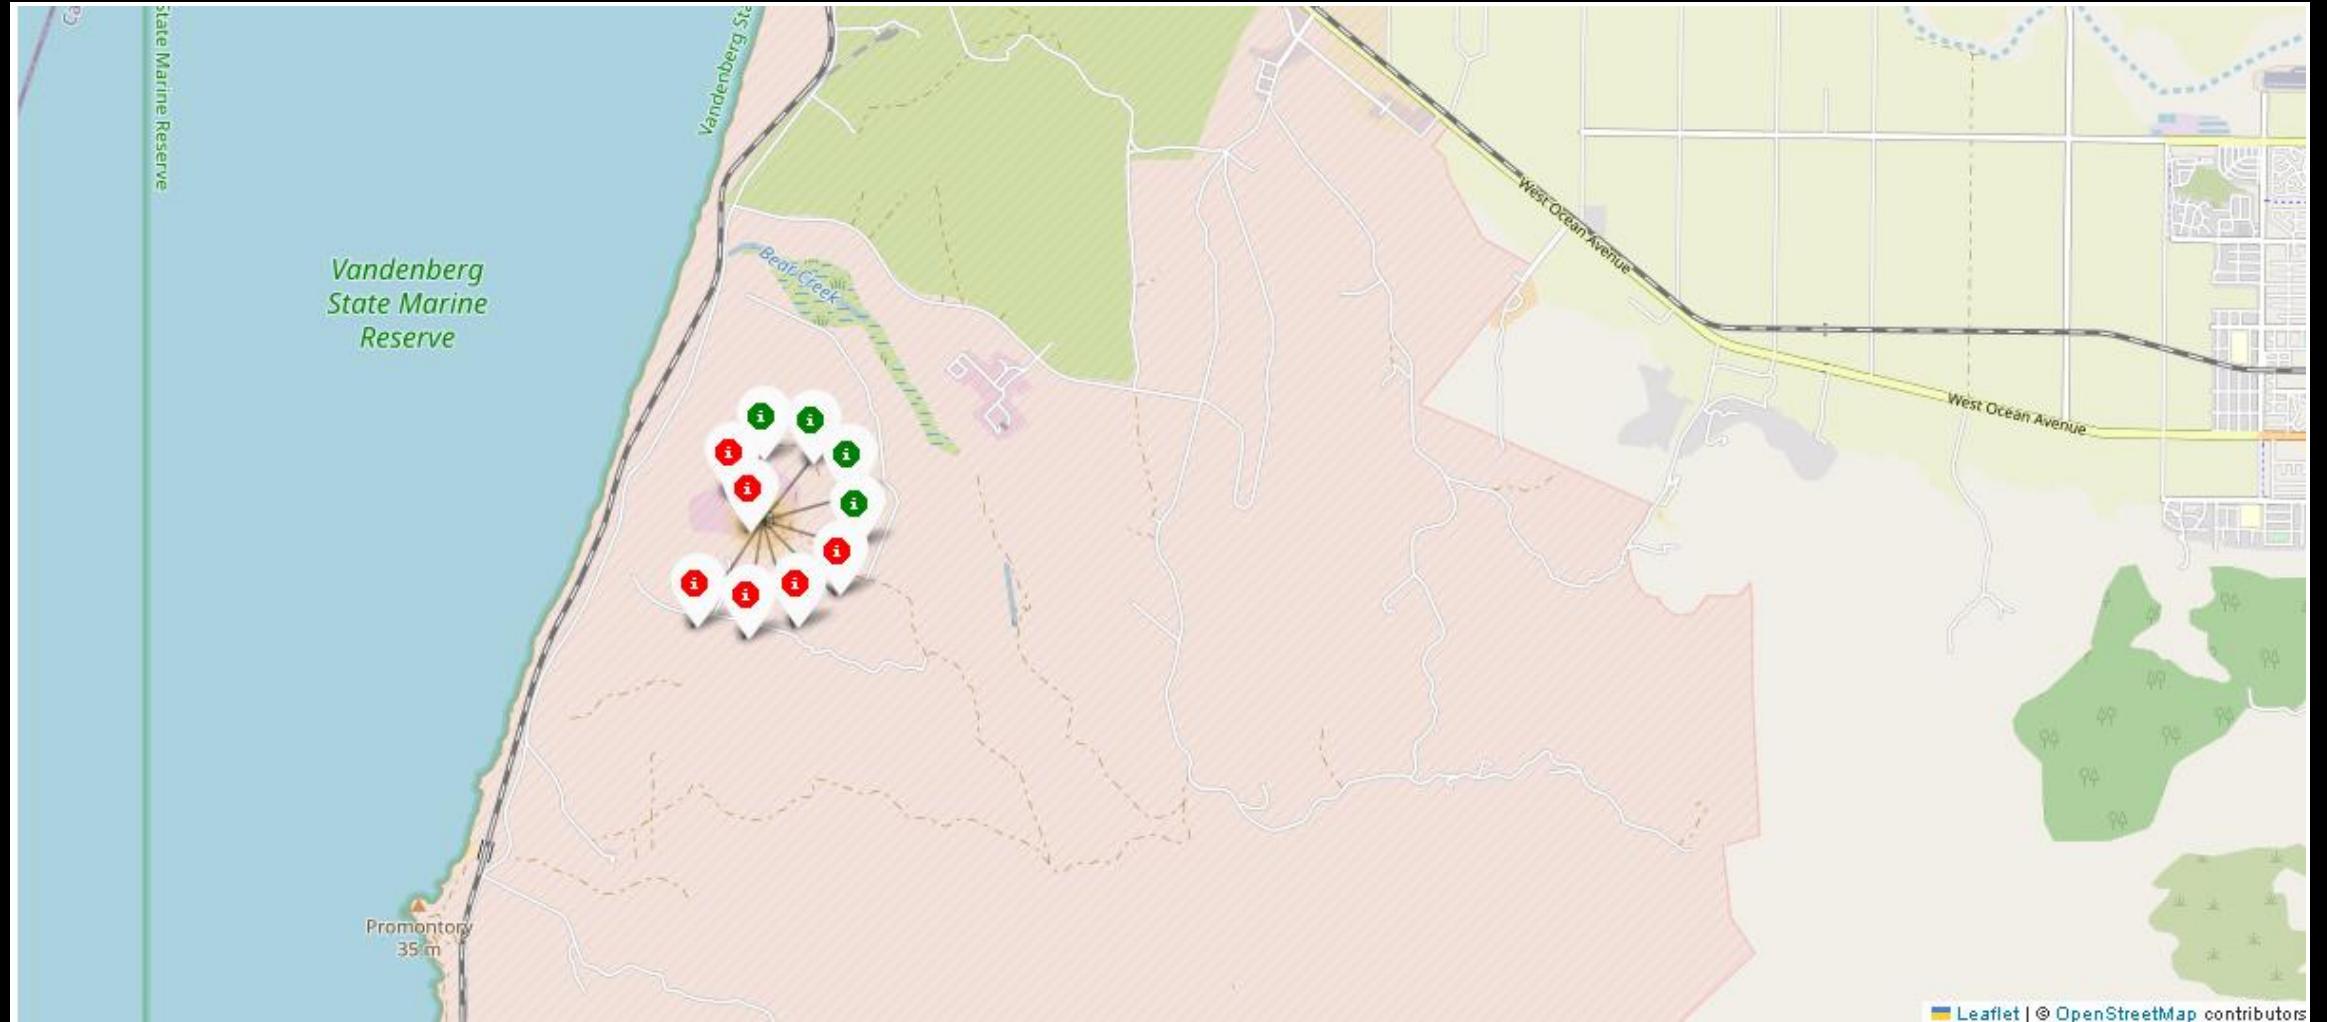

The background of the slide is a photograph taken from space at night. It shows the curvature of the Earth's horizon against a dark blue sky. City lights are visible as numerous small white and yellow dots, primarily concentrated in the lower right quadrant where the United States appears. In the upper left quadrant, the green and yellow glow of the Aurora Borealis (Northern Lights) is visible.

Section 3

# Launch Sites Proximities Analysis

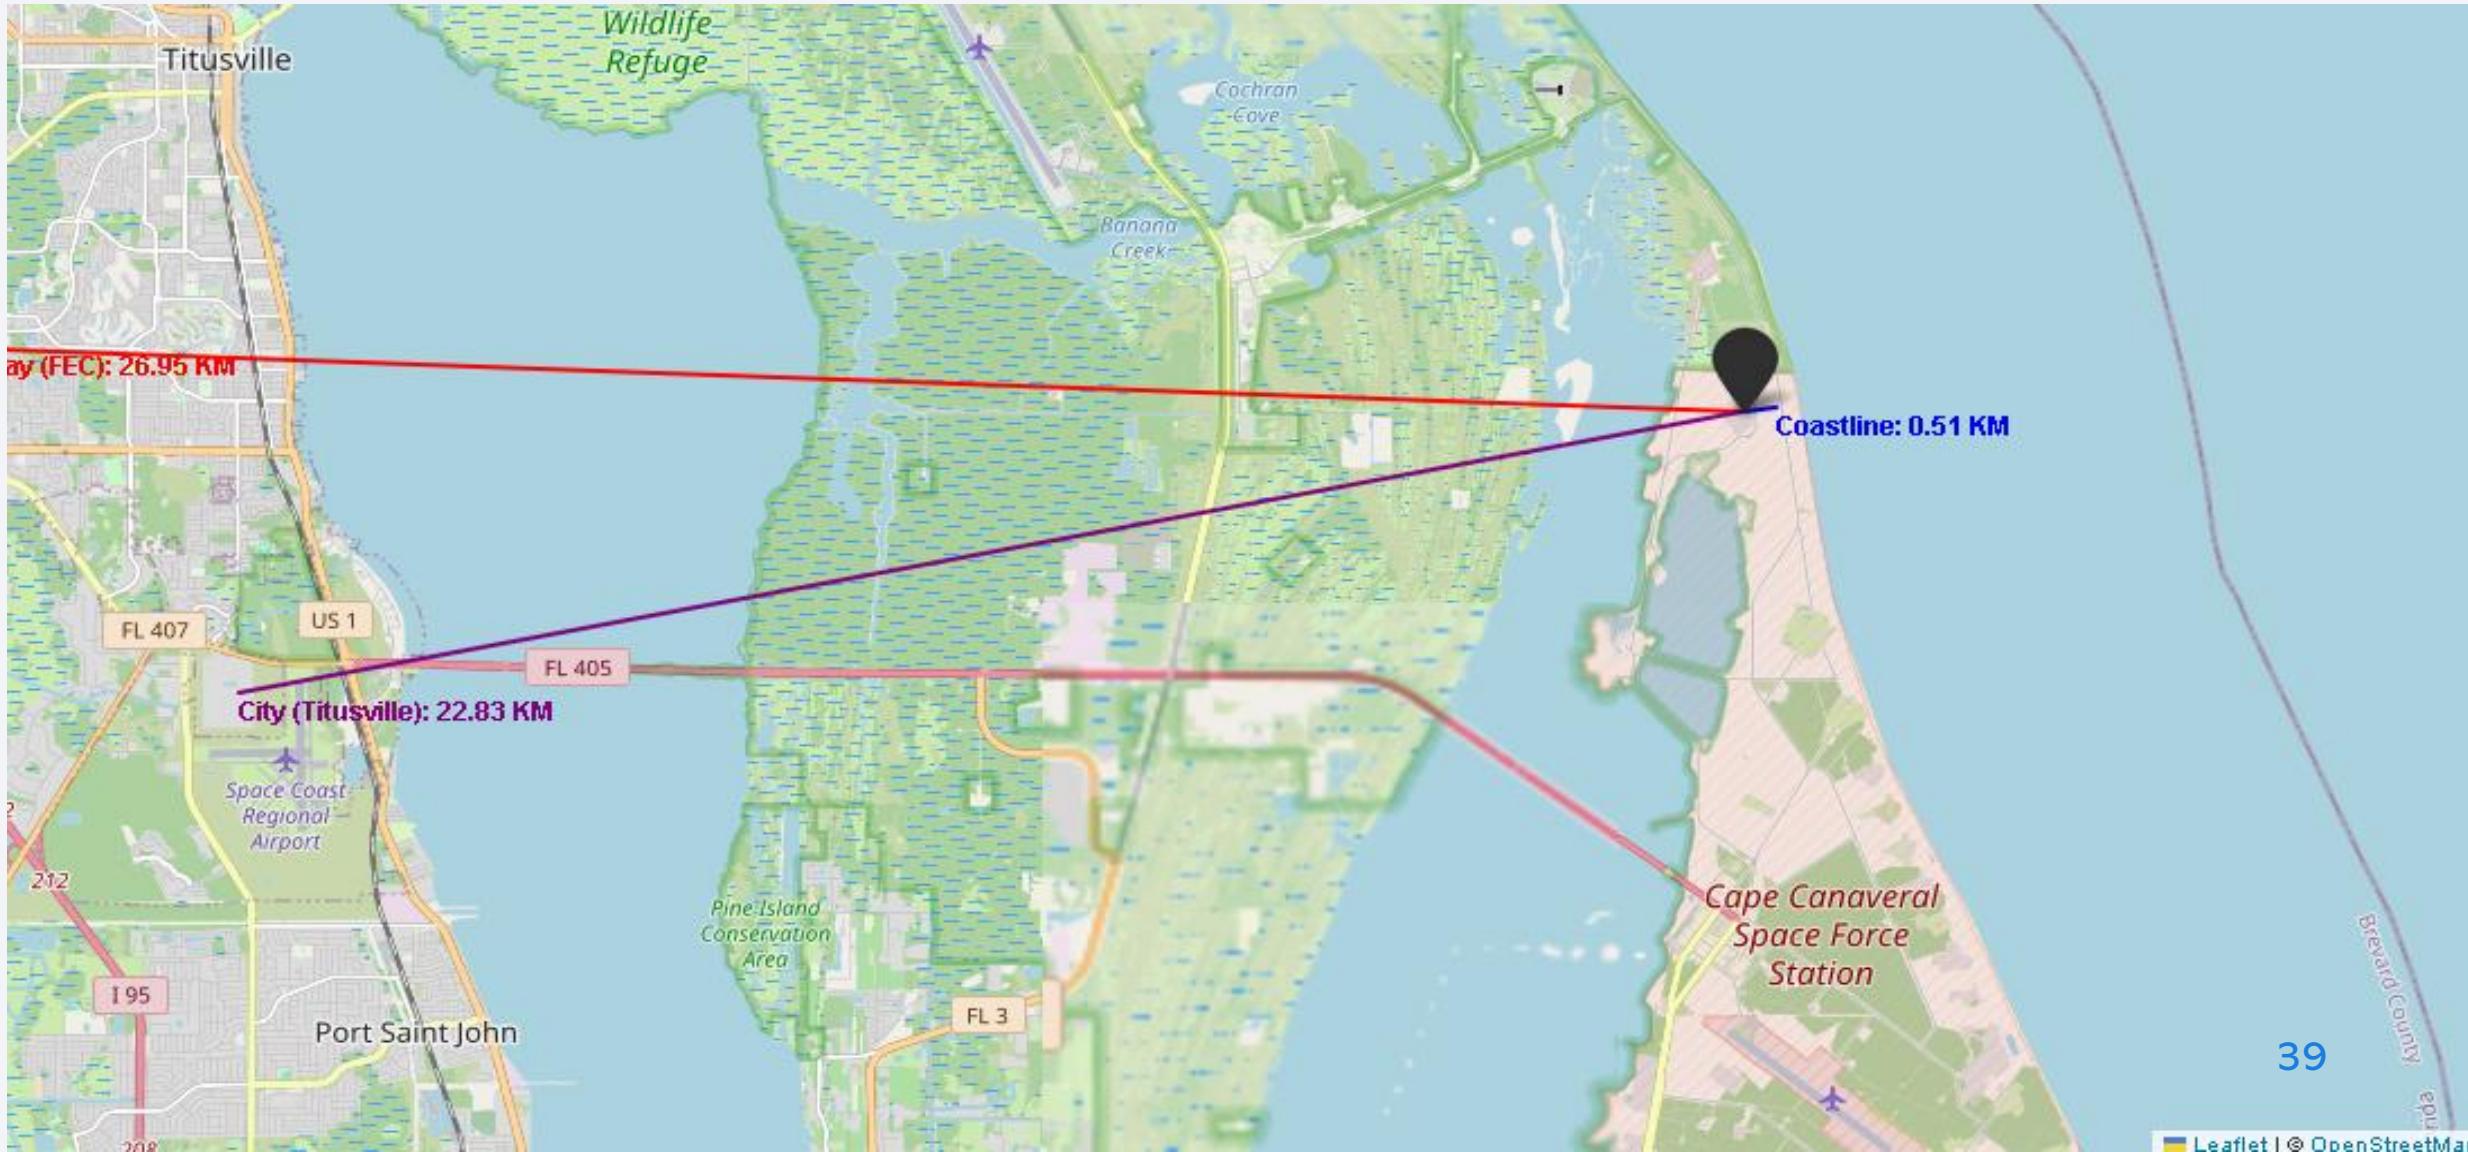

# Launch Site Locations

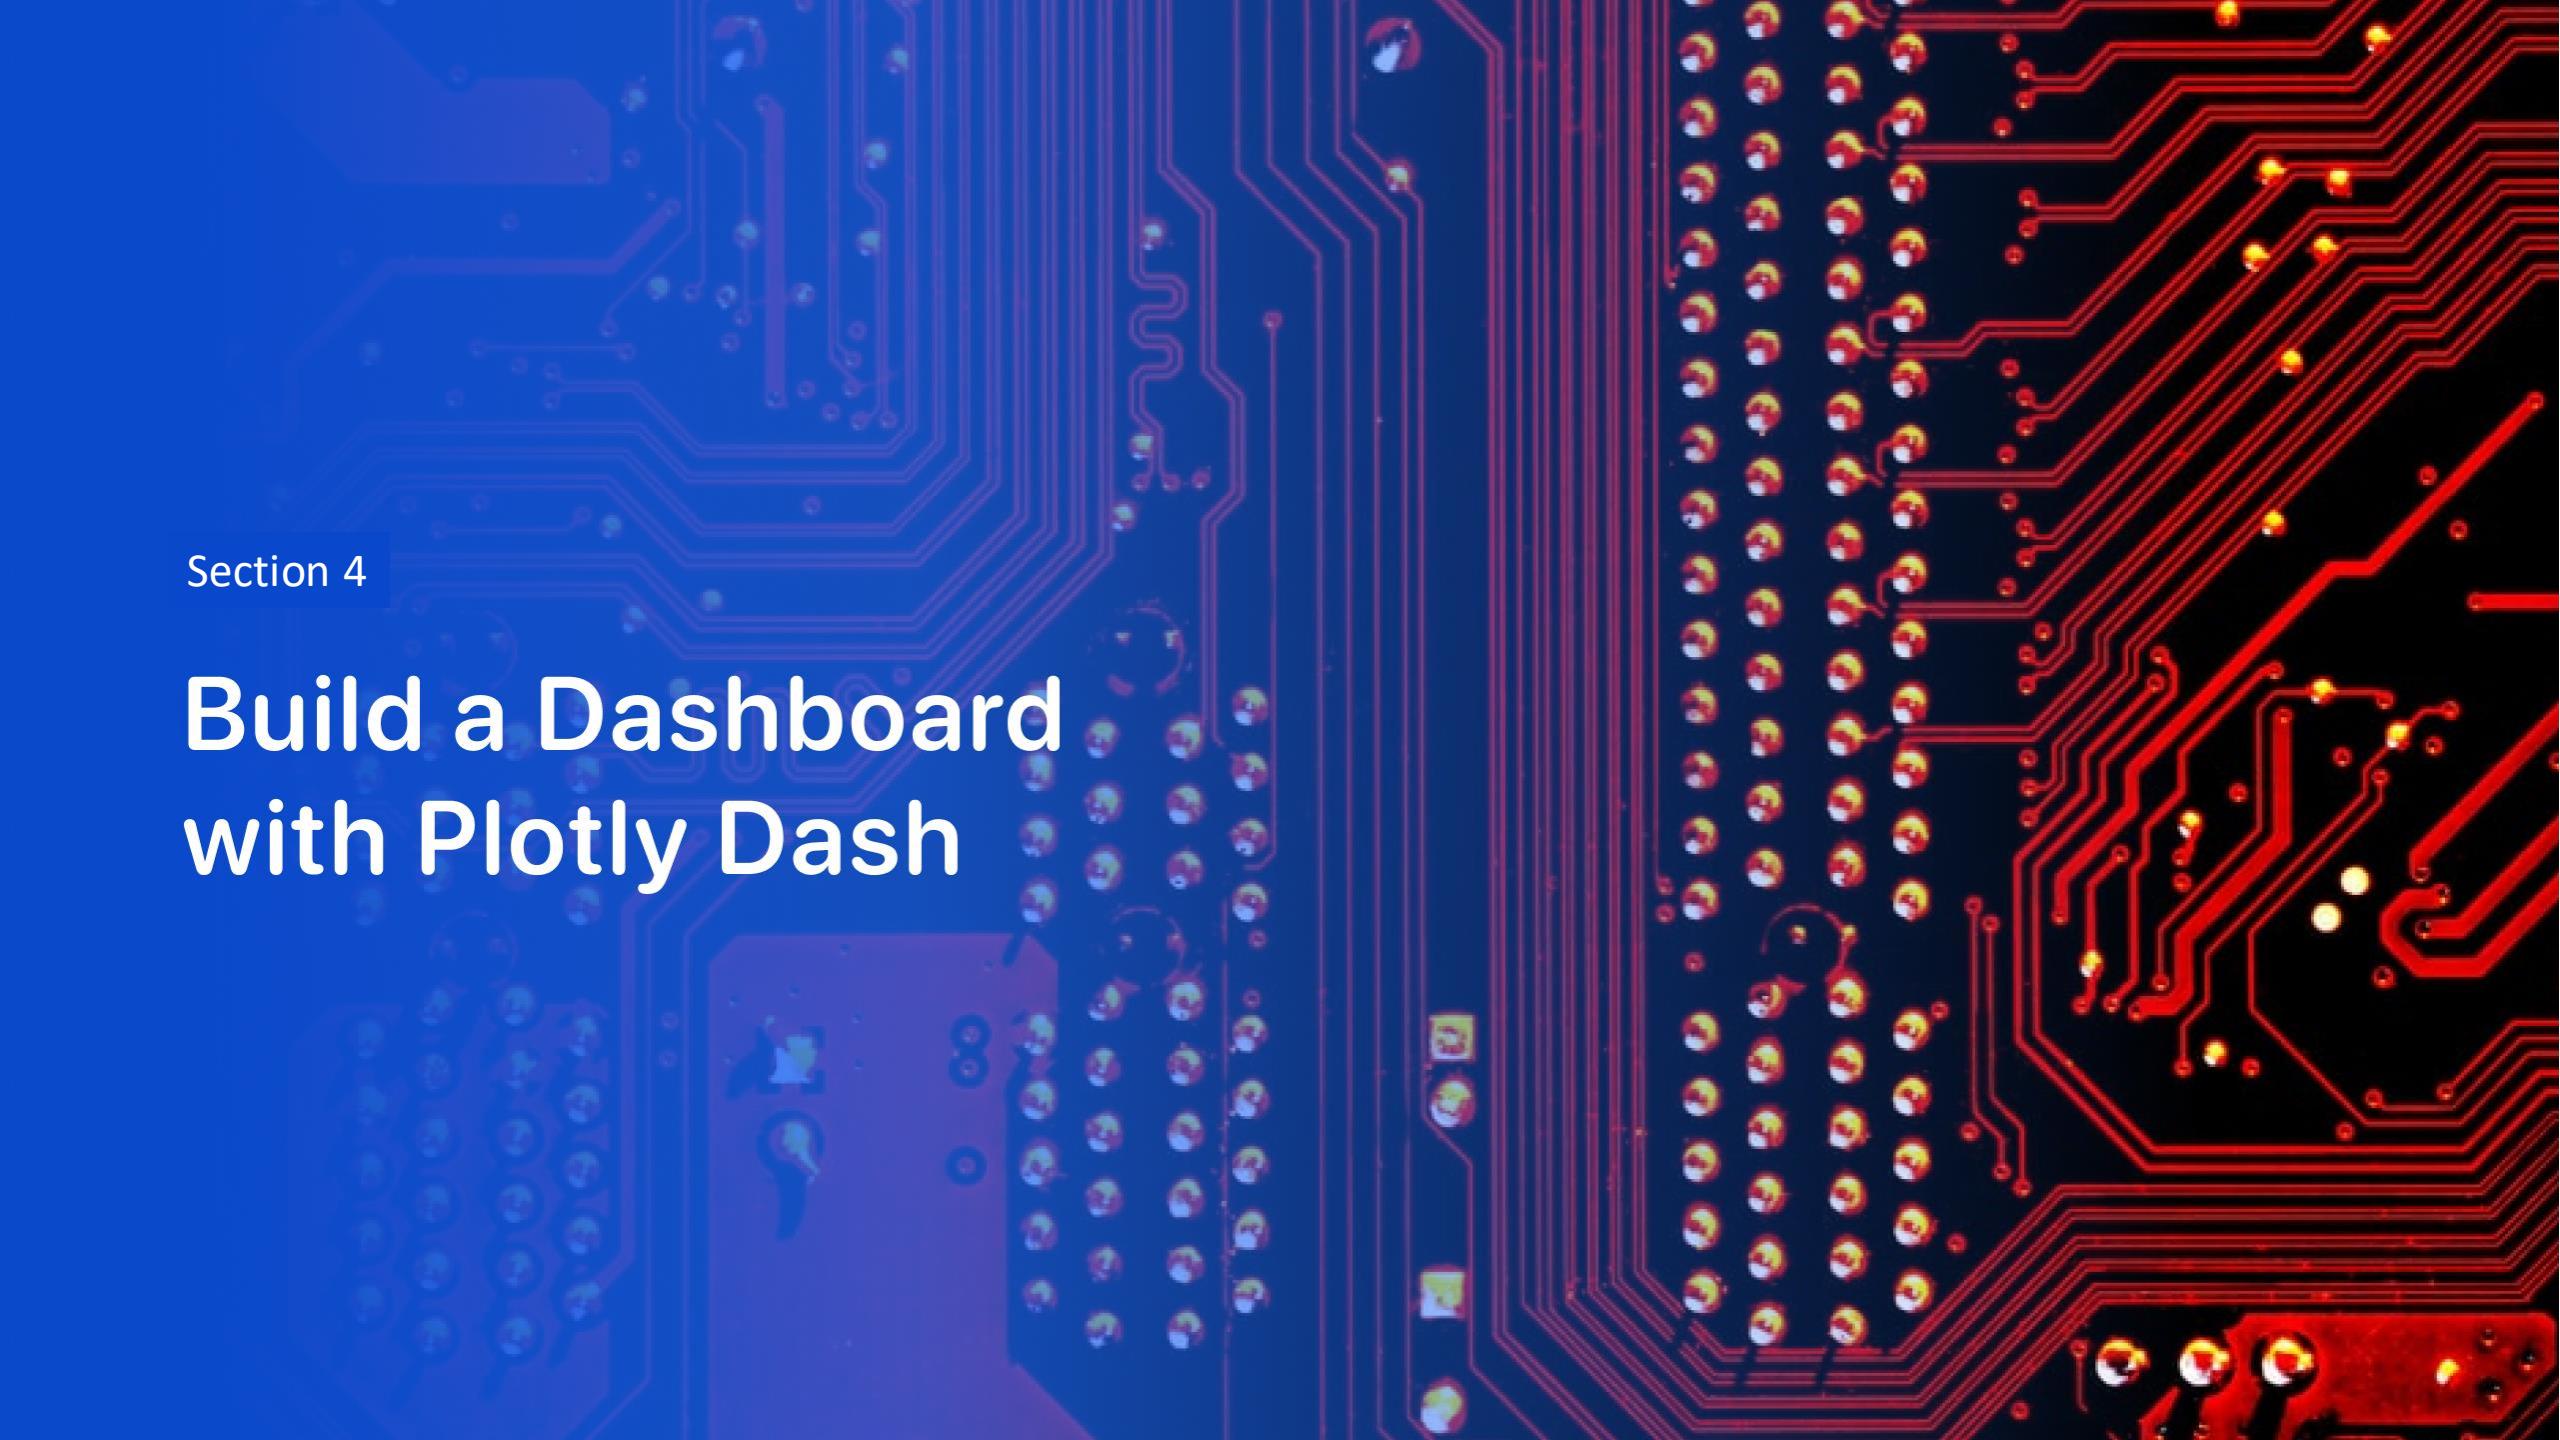

Launch Site Success/Failed markers

# Distance comparison

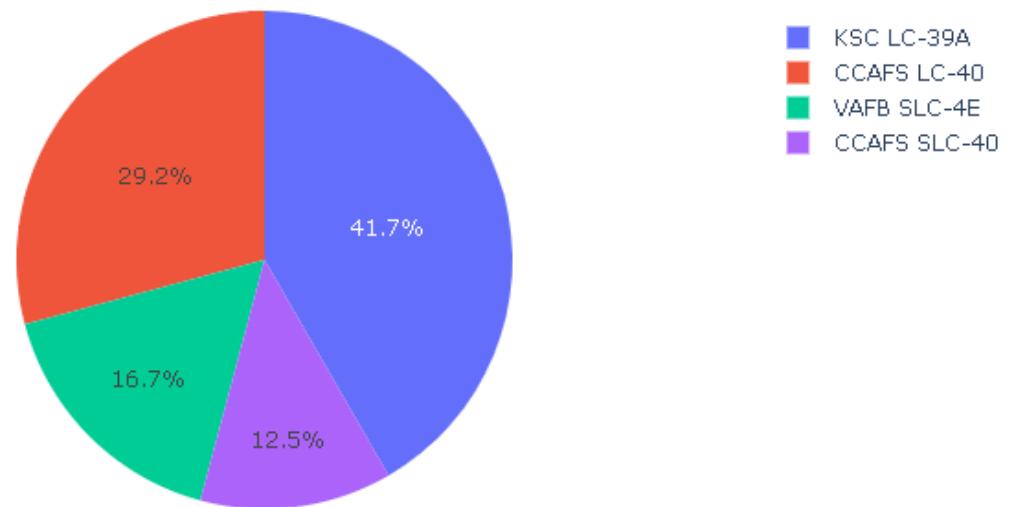

Section 4

# Build a Dashboard with Plotly Dash

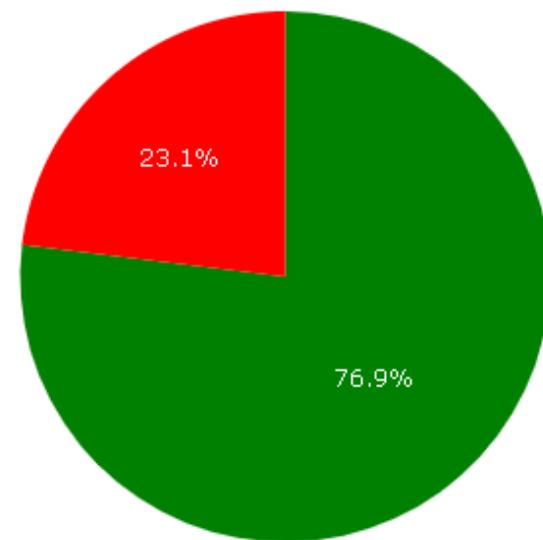

Overall  
success of  
each Launch  
site

Total Successful Launches By Site

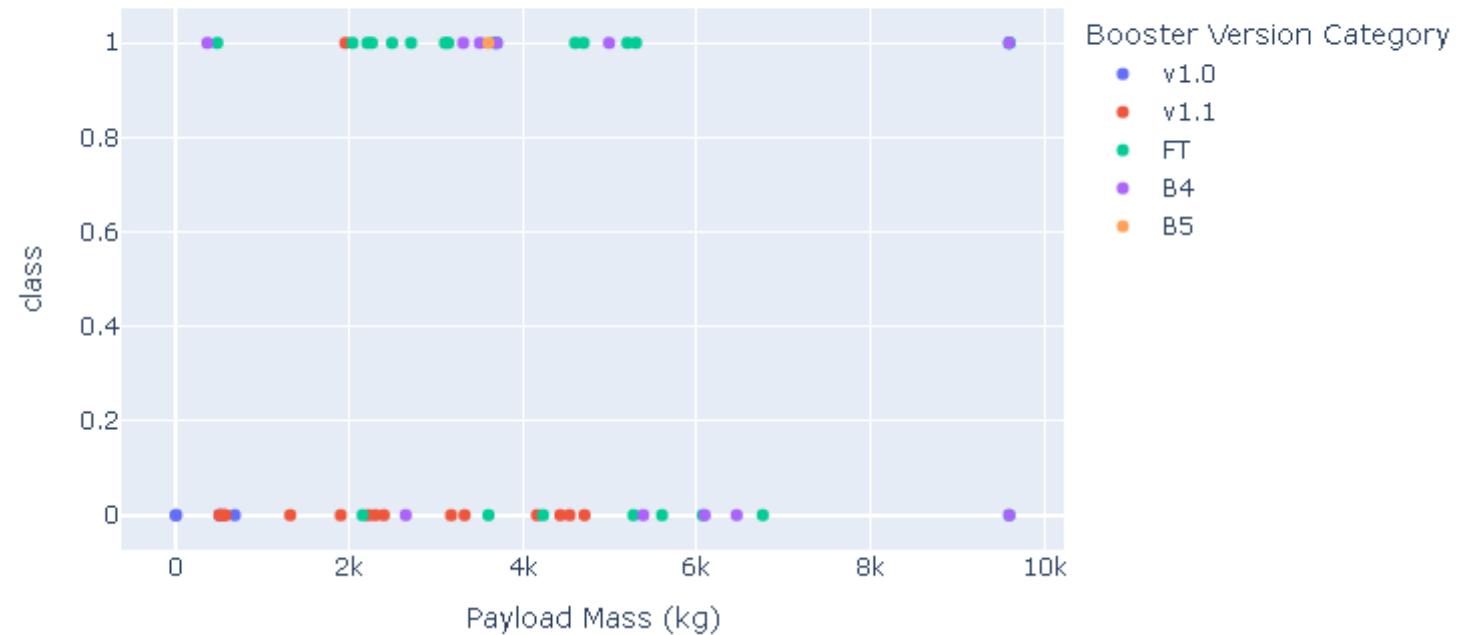

Pie chart  
with the  
highest  
success rate

Total Successful Launches for Site KSC LC-39A

# Scatterplot for all launch sites

## Correlation between Payload and Success for All Sites

The background of the slide features a dynamic, abstract design. It consists of several thick, curved lines that transition from a bright yellow at the top right to a deep blue at the bottom left. These lines create a sense of motion and depth, resembling a tunnel or a stylized landscape. The overall effect is modern and professional.

Section 5

# Predictive Analysis (Classification)

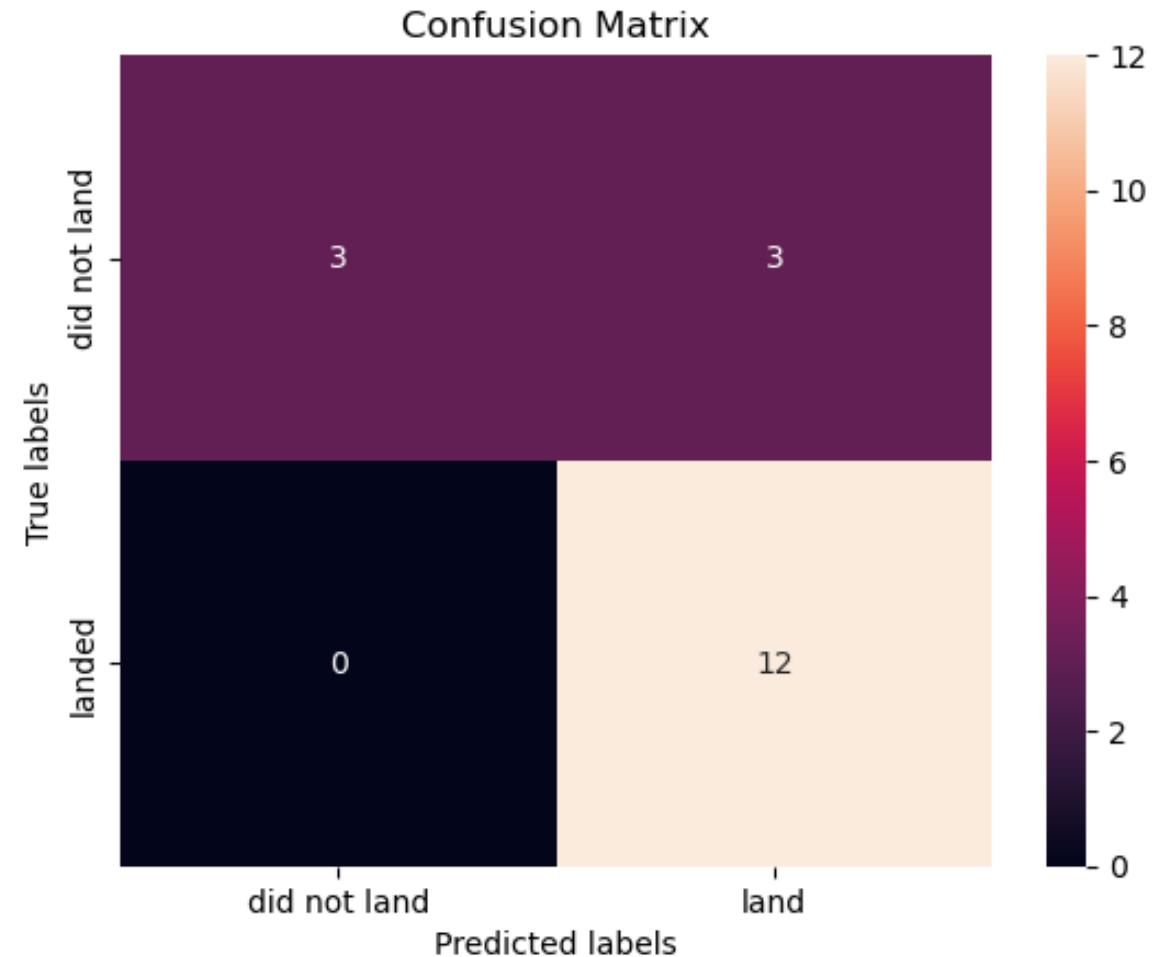

# Classification Accuracy

---

## Results:

- The **Support Vector Classifier (SVC)** emerged as the most effective model for this dataset, achieving the highest overall accuracy of approximately **85%** and strong performance across all metrics.
- The **Logistic Regression** and **Decision Tree** models performed comparably well, both reaching an accuracy of approximately **81%** and balanced F1 scores.
- The **K-Nearest Neighbors (KNN)** model demonstrated significantly lower performance, particularly in precision and F1-score, indicating it was the least suitable model for predicting SpaceX launch outcomes among those tested.

# Confusion Matrix for Support Vector Machines

# Conclusions

- In this project I drew a couple of conclusions :
  - The success rate started to rise in 2013 up to 2020
  - The success rate was high for the following orbits (ES-L1 ,GEO ,HEO and SSO)
  - Different Launch Sites Differ in the payload of the F 9
  - I also noticed that launch sites are usually located far from public infrastructures
  - Support Vector Machines is the best model for prediction for this data set
  - Kenedy Space Center has the highest success rate amongst all the launch sites

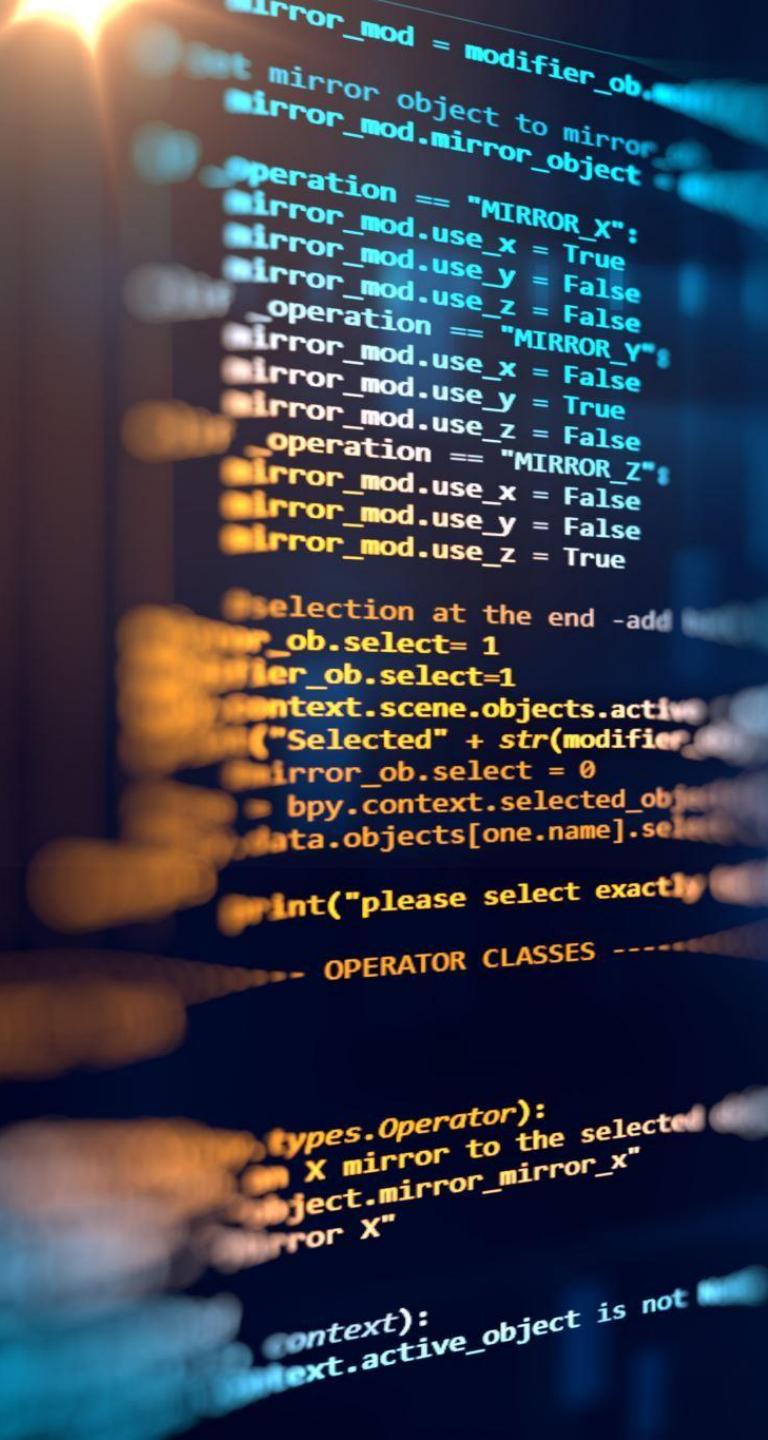

# Appendix

---

- In this project I used various parameters for the predictions models and GridSearch alongside those models

- ❖ Folium map  
<https://github.com/Emitrisia/Emitrisia/blob/main/Interactive%20Visual%20Analytics%20with%20Folium.ipynb>

A hand is pointing at a computer screen displaying Python code for a 3D modeling application, likely Blender. The code involves modifying objects based on user input and specific operator types. The visible code includes logic for selecting objects, setting mirror properties, and handling different operator types like MIRROR\_X, MIRROR\_Y, and MIRROR\_Z.

```
    mirror_mod = modifier_obj
    if mirror_mod:
        mirror_object_to_mirror(mirror_mod.mirror_object)
        if operation == "MIRROR_X":
            mirror_mod.use_x = True
            mirror_mod.use_y = False
            mirror_mod.use_z = False
        elif operation == "MIRROR_Y":
            mirror_mod.use_x = False
            mirror_mod.use_y = True
            mirror_mod.use_z = False
        elif operation == "MIRROR_Z":
            mirror_mod.use_x = False
            mirror_mod.use_y = False
            mirror_mod.use_z = True

    selection_at_the_end = adder_obj.select == 1
    if selection_at_the_end:
        bpy.context.scene.objects.active = modifier_obj
        modifier_obj.select = 0
        bpy.context.selected_objects.append(modifier_obj)
        data.objects[one.name].select = 1
    else:
        print("please select exactly one object")

- OPERATOR CLASSES ----

types.Operator:
    def __init__(self):
        self.mirror_to_the_selected_object.mirror_mirror_x = "mirror X"
        self.mirror_to_the_selected_object.mirror_mirror_y = "mirror Y"
        self.mirror_to_the_selected_object.mirror_mirror_z = "mirror Z"

context:
    def __init__(self):
